(54) Title: INTERLEUKIN-3 (IL-3) MUTANT POLYPEPTIDES			
(57) Abstract			
<p>The present invention relates to a recombinant human interleukin-3 (hIL-3) variant or mutant proteins (muteins). These hIL-3 muteins contain one or more amino acid substitutions and may also have amino acid deletions at both the N- and C-termini. The invention also relates to pharmaceutical compositions containing the hIL-3 muteins and methods for using them. Additionally, the present invention relates to recombinant expression vectors comprising nucleotide sequences encoding the hIL-3 muteins, related microbial expression systems, and processes for making the hIL-3 muteins using the microbial expression systems. Included in the present invention are deletion mutants of hIL-3 in which from 1 to 14 amino acids have been deleted from the N-terminus, and from 1 to 15 amino acids (corresponding to residues 119 to 133) have been deleted from the C-terminus, and which also contain one to three amino acid substitutions in the polypeptide. These hIL-3 mutant polypeptides may have biological activities similar to or better than hIL-3 and, in some cases, may also have an improved side effect profile.</p>

INTERLEUKIN-3 (IL-3) MUTANT POLYPEPTIDES

This is a continuation-in-part of United States Application Serial No. 07/981,044 filed November 24, 1992
5 which is incorporated herein by reference.

Field of the Invention

The present invention relates to mutants or variants
10 of human interleukin-3 (hIL-3) which contain one or more amino acid substitutions and which may have portions of the native hIL-3 molecule deleted. These hIL-3 single and multiple mutation polypeptides retain one or more activities of native hIL-3 and may also show improved
15 hematopoietic cell-stimulating activity and/or an improved activity profile which may include reduction of undesirable biological activities associated with native hIL-3.

Background of the Invention

Colony stimulating factors (CSFs) which stimulate the differentiation and/or proliferation of bone marrow cells have generated much interest because of their
25 therapeutic potential for restoring depressed levels of hematopoietic stem cell-derived cells. CSFs in both human and murine systems have been identified and distinguished according to their activities. For example, granulocyte-CSF (G-CSF) and macrophage-CSF
30 (M-CSF) stimulate the in vitro formation of neutrophilic granulocyte and macrophage colonies, respectively while GM-CSF and interleukin-3 (IL-3) have broader activities and stimulate the formation of both macrophage, neutrophilic and eosinophilic granulocyte colonies. IL-3
35 also stimulates the formation of mast, megakaryocyte and pure and mixed erythroid colonies.

Because of its ability to stimulate the

proliferation of a number of different cell types and to support the growth and proliferation of progenitor cells, IL-3 has potential for therapeutic use in restoring hematopoietic cells to normal amounts in those cases 5 where the number of cells has been reduced due to diseases or to therapeutic treatments such as radiation and chemotherapy.

Interleukin-3 (IL-3) is a hematopoietic growth 10 factor which has the property of being able to promote the survival, growth and differentiation of hematopoietic cells. Among the biological properties of IL-3 are the ability (a) to support the growth and differentiation of progenitor cells committed to all, or virtually all, 15 blood cell lineages; (b) to interact with early multipotential stem cells; (c) to sustain the growth of pluripotent precursor cells; (d) to stimulate proliferation of chronic myelogenous leukemia (CML) cells; (e) to stimulate proliferation of mast cells, 20 eosinophils and basophils; (f) to stimulate DNA synthesis by human acute myelogenous leukemia (AML) cells; (g) to prime cells for production of leukotrienes and histamines; (h) to induce leukocyte chemotaxis; and (i) to induce cell surface molecules needed for leukocyte 25 adhesion.

Mature human interleukin-3 (hIL-3) consists of 133 amino acids. It has one disulfide bridge and two potential glycosylation sites (Yang, et al., CELL 47:3 30 (1986)).

Murine IL-3 (mIL-3) was first identified by Ihle, et al., J. IMMUNOL. 126:2184 (1981) as a factor which induced expression of a T cell associated enzyme, 20 - 35 hydroxysteroid dehydrogenase. The factor was purified to homogeneity and shown to regulate the growth and differentiation of numerous subclasses of early hematopoietic and lymphoid progenitor cells.

In 1984, cDNA clones coding for murine IL-3 were isolated (Fung, et al., NATURE 307:233 (1984) and Yokota, et al., PROC. NATL. ACAD. SCI. USA 81:1070 (1984)). The 5 murine DNA sequence coded for a polypeptide of 166 amino acids including a putative signal peptide.

The gibbon IL-3 sequence was obtained using a gibbon cDNA expression library. The gibbon IL-3 sequence was 10 then used as a probe against a human genomic library to obtain a human IL-3 sequence.

Gibbon and human genomic DNA homologues of the murine IL-3 sequence were disclosed by Yang, et al., CELL 15 47:3 (1986). The human sequence reported by Yang, et al. included a serine residue at position 8 of the mature protein sequence. Following this finding, others reported isolation of Pro⁸ hIL-3 cDNAs having proline at position 8 of the protein sequence. Thus it appears that 20 there may be two allelic forms of hIL-3.

Dorssers, et al., GENE 55:115 (1987), found a clone from a human cDNA library which hybridized with mIL-3. This hybridization was the result of the high degree of 25 homology between the 3' noncoding regions of mIL-3 and hIL-3. This cDNA coded for an hIL-3 (Pro⁸) sequence.

U.S. 4,877,729 and U.S. 4,959,454 disclose human 30 IL-3 and gibbon IL-3 cDNAs and the protein sequences for which they code. The hIL-3 disclosed has serine rather than proline at position 8 in the protein sequence.

Clark-Lewis, et al., SCIENCE 231:134 (1986) performed a functional analysis of murine IL-3 analogues 35 synthesized with an automated peptide synthesizer. The authors concluded that the stable tertiary structure of the complete molecule was required for full activity. A study on the role of the disulfide bridges showed that

replacement of all four cysteines by alanine gave a molecule with 1/500th the activity as the native molecule. Replacement of two of the four Cys residues by Ala(Cys⁷⁹, Cys¹⁴⁰ -> Ala⁷⁹, Ala¹⁴⁰) resulted in an increased activity. The authors concluded that in murine IL-3 a single disulfide bridge is required between cysteines 17 and 80 to get biological activity that approximates physiological levels and that this structure probably stabilizes the tertiary structure of the protein to give a conformation that is optimal for function. (Clark-Lewis, et al., PROC. NATL. ACAD. SCI. USA 85:7897 (1988)).

International Patent Application (PCT) WO 88/00598 discloses gibbon- and human-like IL-3. The hIL-3 contains a Ser⁸ -> Pro⁸ replacement. Suggestions are made to replace Cys by Ser, thereby breaking the disulfide bridge, and to replace one or more amino acids at the glycosylation sites.

EP-A-0275598 (WO 88/04691) illustrates that Alal can be deleted while retaining biological activity. Some mutant hIL-3 sequences are provided, e.g., two double mutants, Alal -> Asp¹, Trp¹³ -> Arg¹³ (pGB/IL-302) and Alal -> Asp¹, Met³ -> Thr³ (pGB/IL-304) and one triple mutant Alal -> Asp¹, Leu⁹ -> Pro⁹, Trp¹³ -> Arg¹³ (pGB/IL-303).

WO 88/05469 describes how deglycosylation mutants can be obtained and suggests mutants of Arg⁵⁴Arg⁵⁵ and Arg¹⁰⁸Arg¹⁰⁹Lys¹¹⁰ might avoid proteolysis upon expression in Saccharomyces cerevisiae by KEX2 protease. No mutated proteins are disclosed. Glycosylation and the KEX2 protease activity are only important, in this context, upon expression in yeast.

WO 88/06161 mentions various mutants which theoretically may be conformationally and antigenically

neutral. The only actually performed mutations are Met² -> Ile² and Ile¹³¹ -> Leu¹³¹. It is not disclosed whether the contemplated neutralities were obtained for these two mutations.

5

WO 91/00350 discloses nonglycosylated hIL-3 analog proteins, for example, hIL-3 (Pro⁸Asp¹⁵Asp⁷⁰), Met³ rhuL-3 (Pro⁸Asp¹⁵Asp⁷⁰); Thr⁴ rhuL-3 (Pro⁸Asp¹⁵Asp⁷⁰) and Thr⁶ rhuIL-3 (Pro⁸Asp¹⁵Asp⁷⁰). It is said that these 10 protein compositions do not exhibit certain adverse side effects associated with native hIL-3 such as urticaria resulting from infiltration of mast cells and lymphocytes into the dermis. The disclosed analog hIL-3 proteins may have N termini at Met³, Thr⁴, or Thr⁶.

15

WO 91/12874 discloses cysteine added variants (CAVs) of IL-3 which have at least one Cys residue substituted for a naturally occurring amino acid residue.

20

SUMMARY OF THE INVENTION

The present invention relates to recombinant human interleukin-3 (hIL-3) variant or mutant proteins (muteins). These hIL-3 muteins contain amino acid 25 substitutions and may also have amino acid deletions at either/or both the N- and C- termini. Preferably, these mutant polypeptides of the present invention contain one to three amino acids which differ from the amino acids found at the corresponding positions in the native hIL-3 30 polypeptide. The invention also relates to pharmaceutical compositions containing the hIL-3 muteins, DNA coding for the muteins, and methods for using the muteins. Additionally, the present invention relates to recombinant expression vectors comprising nucleotide 35 sequences encoding the hIL-3 muteins, related microbial expression systems, and processes for making the hIL-3 muteins using the microbial expression systems.

The present invention includes mutants of hIL-3 in which from 1 to 14 amino acids have been deleted from the N-terminus and/or from 1 to 15 amino acids have been deleted from the C-terminus, and in which from one to three amino acid substitutions have been made. Preferred muteins of the present invention are those in which amino acids 1 to 14 have been deleted from the N-terminus, or amino acids 126 to 133 have been deleted from the C-terminus, and which both also contain from one to three amino acid substitutions in the polypeptide sequence.

These hIL-3 multiple mutation polypeptides may have biological activities similar to or better than hIL-3 and, in some cases, may also have an improved side effect profile, i.e., some muteins may have a better therapeutic index than native hIL-3. The present invention also provides muteins which may function as IL-3 antagonists or as discrete antigenic fragments for the production of antibodies useful in immunoassay and immunotherapy protocols. In addition to the use of the hIL-3 mutant polypeptides of the present invention in vivo, it is envisioned that in vitro uses would include the ability to stimulate bone marrow and blood cell activation and growth before infusion into patients.

Antagonists of hIL-3 would be particularly useful in blocking the growth of certain cancer cells like AML, CML and certain types of B lymphoid cancers. Other conditions where antagonists would be useful include those in which certain blood cells are produced at abnormally high numbers or are being activated by endogenous ligands. Antagonists would effectively compete for ligands, presumably naturally occurring hemopoietins including and not limited to IL-3, GM-CSF and IL-5, which might trigger or augment the growth of cancer cells by virtue of their ability to bind to the IL-3 receptor complex while intrinsic activation properties of the ligand are diminished. IL-3, GM-CSF and or IL-5 also play a role in certain asthmatic responses.

An antagonist of the IL-3 receptor may have utility in this disease by blocking receptor-mediated activation and recruitment of inflammatory cells.

5

BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 is the human IL-3 gene for *E. coli* expression (pMON5873), encoding the polypeptide sequence of natural (wild type) human IL-3 [SEQ ID NO:128], plus 10 an initiator methionine, as expressed in *E. coli*, with the amino acids numbered from the N-terminus of the natural hIL-3.

Figure 2: ClaI to NsiI Replacement Fragment.
15 Figure 2 shows the nucleotide sequence of the replacement fragment used between the ClaI and NsiI sites of the hIL-3 gene. The codon choice used in the fragment corresponds to that found in highly expressed *E. coli* genes (Gouy and Gautier, 1982). Three new unique 20 restriction sites, EcoRV, XhoI and PstI were introduced for the purpose of inserting synthetic gene fragments. The portion of the coding sequence shown encodes hIL-3 amino acids 20-70.

25 Figure 3 shows the nucleotide and amino acid sequence of the gene in pMON5873 with the sequence extending from NcoI through HindIII. The codon choices used to encode amino acids 1-14 and 107-133 correspond to that found in highly expressed *E. coli* genes.
30

Figure 4 shows the construction of the plasmid vector pMON5846 which encodes [Met-(1-133) hIL-3 (Arg¹²⁹)].

35 Figure 5 shows the construction of the plasmid vector pMON5847 (ATCC 68912) which encodes [Met-(1-133) hIL-3 (Arg¹²⁹)].

Figure 6 shows the construction of plasmid vector pMON5853 which encodes [Met-(15-133) hIL-3 (Arg¹²⁹)].

5 Figure 7 shows the construction of the plasmid vector pMON5854 which encodes [Met-(1-133) hIL-3 (Arg¹²⁹)].

10 Figure 8 shows the DNA sequence and resulting amino acid sequence of the lamB signal peptide.

Figure 9 shows the construction of the plasmid vector pMON5978 which encodes Met-Ala-(15-125)hIL-3.

15 Figure 10 shows the construction of the plasmid vector pMON5988 which encodes Met-Ala(15-125)hIL-3.

Figure 11 shows the construction of the plasmid vector pMON5887 which encodes Met-(1-125)hIL-3.

20 Figure 12 shows the construction of pMON6457 which encodes (15-125)hIL-3; it contains the araBAD promoter and the lamB signal peptide fused to the variant hIL-3 amino acids 15-125.

25 Figure 13 shows the construction of pMON6458; it contains the araBAD promoter and the lamB signal peptide fused to the variant hIL-3 amino acids 15-125.

30 Figure 14 shows the construction of pMON6467 in which the bases encoding amino acids 35-40 of hIL-3 were deleted using site-directed PCR mutagenesis methods. pMON6467 was used as the template for the generation of single amino acid variants at positions 35-40 of hIL-3.

35 Figure 15 shows the construction of single amino acid substitutions at position 35 of hIL-3 using site-directed PCR mutagenesis methods. The mutagenesis results in 20 different single amino substitutions, which is

referred to as a "library", at position 35 of hIL-3.

DETAILED DESCRIPTION OF THE INVENTION

5 The present invention relates to muteins of human interleukin-3 (hIL-3) in which amino acid substitutions have been made at from one to three positions in the amino acid sequence of the polypeptide and to hIL-3 muteins which have substantially the same structure and
10 substantially the same biological activity. Preferred muteins of the present invention are (15-125)hIL-3 deletion mutants which have deletions of amino acids 1 to 14 at the N-terminus and/or 126 to 133 at the C-terminus and which both also have from one to three amino acid
15 substitutions in the polypeptide and muteins having substantially the same structure and substantially the same biological activity. As used herein human interleukin-3 corresponds to the amino acid sequence (1-133) as depicted in Figure 1 and (15-125) hIL-3
20 corresponds to the 15 to 125 amino acid sequence of the hIL-3 polypeptide. Naturally occurring variants of hIL-3 polypeptide amino acids are also included in the present invention (for example, the allele in which proline rather than serine is at position 8 in the hIL-3
25 polypeptide sequence) as are variant hIL-3 molecules which are modified post-translationally (e.g. glycosylation).

30 The present invention also includes the DNA sequences which code for the mutant polypeptides, DNA sequences which are substantially similar and perform substantially the same function, and DNA sequences which differ from the DNAs encoding the muteins of the invention only due to the degeneracy of the genetic code.
35

Included in the present invention are novel mutant human interleukin-3 polypeptides comprising a polypeptide having the amino acid sequence of native human

10

interleukin-3 wherein amino acids 126 to 133 have been deleted from the C-terminus of the native human interleukin-3 polypeptide and amino acids 1 to 14 have been deleted from the N-terminus of the native human interleukin-3 polypeptide and, in addition, polypeptides of the present invention also have one to three amino acid substitutions in the polypeptide sequence. The muteins of the present invention can have from one to three amino acid substitutions in the hIL-3 polypeptide chain and, in addition, can have deletions of amino acids at the N-terminus and/or the C-terminus.

Also included in the present invention are the DNA sequences coding for the muteins of the present invention; the oligonucleotide intermediates used to construct the mutant DNAs; and the polypeptides coded for by these oligonucleotides. These polypeptides may be useful as antagonists or as antigenic fragments for the production of antibodies useful in immunoassay and immunotherapy protocols.

The mutant hIL-3 polypeptides of the present invention may also have methionine, alanine, or methionine-alanine residues inserted at the N-terminus.

The present invention includes hIL-3 mutant polypeptides of the formula I:

Xaa at position 81 is Leu, Gln, Gly, Ala, Trp, Arg, Val, or Lys;
Xaa at position 82 is Leu, Gln, Lys, Trp, Arg, Asp, Glu, Asn, His, Thr, Ser, Ala, Tyr, Phe, Ile, Met or Val;
- 30 Xaa at position 83 is Pro, Ala, Thr, Trp, Arg, or Met;
Xaa at position 84 is Cys, Glu, Gly, Arg, Met, or Val;
Xaa at position 85 is Leu, Asn, Val, or Gln;
Xaa at position 86 is Pro, Cys, Arg, Ala, or Lys;
Xaa at position 87 is Leu, Ser, Trp, or Gly;
- 35 Xaa at position 88 is Ala, Lys, Arg, Val, or Trp;
Xaa at position 89 is Thr, Asp, Cys, Leu, Val, Glu, His, Asn, or Ser;
- Xaa at position 90 is Ala, Pro, Ser, Thr, Gly, Asp, Ile, or Met;

- Xaa at position 91 is Ala, Pro, Ser, Thr, Phe, Leu, Asp, or His;
Xaa at position 92 is Pro, Phe, Arg, Ser, Lys, His, Ala, Gly, Ile
or Leu;
- Xaa at position 93 is Thr, Asp, Ser, Asn, Pro, Ala, Leu, or Arg;
- 5 Xaa at position 94 is Arg, Ile, Ser, Glu, Leu, Val, Gln, Lys, His,
Ala, or Pro;
- Xaa at position 95 is His, Gln, Pro, Arg, Val, Leu, Gly, Thr, Asn,
Lys, Ser, Ala, Trp, Phe, Ile, or Tyr;
- Xaa at position 96 is Pro, Lys, Tyr, Gly, Ile, or Thr;
- 10 Xaa at position 97 is Ile, Val, Lys, Ala, or Asn;
- Xaa at position 98 is His, Ile, Asn, Leu, Asp, Ala, Thr,
Glu, Gln, Ser, Phe, Met, Val, Lys, Arg, Tyr or Pro;
- Xaa at position 99 is Ile, Leu, Arg, Asp, Val, Pro, Gln,
Gly, Ser, Phe, or His;
- 15 Xaa at position 100 is Lys, Tyr, Leu, His, Arg, Ile, Ser, Gln,
or Pro;
- Xaa at position 101 is Asp, Pro, Met, Lys, His, Thr, Val,
Tyr, Glu, Asn, Ser, Ala, Gly, Ile, Leu, or Gln;
- Xaa at position 102 is Gly, Leu, Glu, Lys, Ser, Tyr, or Pro;
- 20 Xaa at position 103 is Asp, or Ser;
- Xaa at position 104 is Trp, Val, Cys, Tyr, Thr, Met, Pro, Leu,
Gln, Lys, Ala, Phe, or Gly;
- Xaa at position 105 is Asn, Pro, Ala, Phe, Ser, Trp, Gln, Tyr,
Leu, Lys, Ile, Asp, or His;
- 25 Xaa at position 106 is Glu, Ser, Ala, Lys, Thr, Ile, Gly, or Pro;
Xaa at position 108 is Arg, Lys, Asp, Leu, Thr, Ile, Gln, His, Ser,
Ala or Pro;
- Xaa at position 109 is Arg, Thr, Pro, Glu, Tyr, Leu, Ser, or Gly;
- Xaa at position 110 is Lys, Ala, Asn, Thr, Leu, Arg, Gln, His, Glu,
30 Ser, Ala, or Trp;
- Xaa at position 111 is Leu, Ile, Arg, Asp, or Met;
- Xaa at position 112 is Thr, Val, Gln, Tyr, Glu, His, Ser, or Phe;
- Xaa at position 113 is Phe, Ser, Cys, His, Gly, Trp, Tyr, Asp,
Lys, Leu, Ile, Val or Asn;
- 35 Xaa at position 114 is Tyr, Cys, His, Ser, Trp, Arg, or Leu;
Xaa at position 115 is Leu, Asn, Val, Pro, Arg, Ala, His, Thr,
Trp, or Met;
- Xaa at position 116 is Lys, Leu, Pro, Thr, Met, Asp, Val, Glu,

- Arg, Trp, Ser, Asn, His, Ala, Tyr, Phe, Gln, or Ile;
 Xaa at position 117 is Thr, Ser, Asn, Ile, Trp, Lys, or Pro;
 Xaa at position 118 is Leu, Ser, Pro, Ala, Glu, Cys, Asp, or Tyr;
 Xaa at position 119 is Glu, Ser, Lys, Pro, Leu, Thr, Tyr, or Arg;
- 5 Xaa at position 120 is Asn, Ala, Pro, Leu, His, Val, or Gln;
 Xaa at position 121 is Ala, Ser, Ile, Asn, Pro, Lys, Asp, or
 Gly;
- Xaa at position 122 is Gln, Ser, Met, Trp, Arg, Phe, Pro, His,
 Ile, Tyr, or Cys;
- 10 Xaa at position 123 is Ala, Met, Glu, His, Ser, Pro, Tyr, or Leu;
 and which can additionally have Met- preceding the amino acid in
 position 1; and wherein from 1 to 14 amino acids can be deleted
 from the N-terminus and/or from 1 to 15 amino acids can be deleted
 from the C-terminus; and wherein from one to three of the amino
- 15 acids designated by Xaa are different from the corresponding amino
 acids of native (1-133) human interleukin-3 with the proviso that
 when Xaa at position 22 is Leu, and/or Xaa at position 34 is Gly or
 Glu, and/or Xaa at position 44 is Ala, and/or Xaa at position 46 is
 Lys or Ala, and/or Xaa at position 50 is Lys, and/or Xaa at
- 20 position 59 is Pro or Arg, and/or Xaa at position 63 is Lys, and/or
 Xaa at position 75 is Gly or Arg, and/or Xaa at position 94 is Pro,
 and/or Xaa at position 98 is Arg, and/or Xaa at position 106 is
 Lys, and/or Xaa at position 110 is Ala or Glu, and/or Xaa at
 position 111 is Met, then there must be at least one additional
- 25 substitution besides the ones indicated.

Included in the present invention are (1-133)hIL-3
 mutant polypeptides of the Formula II:

position 1; and wherein from 1 to 14 amino acids can be deleted
25 from the N-terminus and/or from 1 to 15 amino acids can be deleted
from the C-terminus; and wherein from one to three of the amino
acids designated by Xaa are different from the corresponding amino
acids of native (1-133)human interleukin-3.

30 Preferred polypeptides of the present invention are (15-
125)hIL-3 mutant polypeptides of the Formula V:

Xaa Xaa Xaa Xaa Gln Gln [SEQ ID NO:19]

110

wherein

20 Xaa at position 3 is Ser, Lys, Gly, Asp, Met, Gln, or Arg;
Xaa at position 4 is Asn, His, Leu, Ile, Phe, Arg, or Gln;
Xaa at position 5 is Met, Phe, Ile, Arg, Gly, Ala, or Cys;
Xaa at position 6 is Ile, Cys, Gln, Glu, Arg, Pro, or Ala;
Xaa at position 7 is Asp, Phe, Lys, Arg, Ala, Gly, Glu, Gln, Asn,
Thr, Ser or Val;

25 Xaa at position 8 is Glu, Trp, Pro, Ser, Ala, His, Asp, Asn, Gln,
Leu, Val, or Gly;

Xaa at position 9 is Ile, Val, Ala, Leu, Gly, Trp, Lys, Phe,
Leu, Ser, or Arg;

Xaa at position 10 is Ile, Gly, Val, Arg, Ser, Phe, or Leu;

30 Xaa at position 11 is Thr, His, Gly, Gln, Arg, Pro, or Ala;
Xaa at position 12 is His, Thr, Phe, Gly, Arg, Ala, or Trp;
Xaa at position 13 is Leu, Gly, Arg, Thr, Ser, or Ala;
Xaa at position 14 is Lys, Arg, Leu, Gln, Gly, Pro, Val or Trp;
Xaa at position 15 is Gln, Asn, Leu, Pro, Arg, or Val;

35 Xaa at position 16 is Pro, His, Thr, Gly, Asp, Gln, Ser, Leu, or
Lys;

Xaa at position 17 is Pro, Asp, Gly, Ala, Arg, Leu, or Gln;

Xaa at position 18 is Leu, Val, Arg, Gln, Asn, Glu, Ala, or Gln.

- Xaa at position 19 is Pro, Leu, Gln, Ala, Thr, or Glu;
- Xaa at position 20 is Leu, Val, Gly, Ser, Lys, Glu, Gln, Thr, Arg, Ala, Phe, Ile or Met;
- Xaa at position 21 is Leu, Ala, Gly, Asn, Pro, Gln, or Val;
- 5 Xaa at position 22 is Asp, Leu, or Val;
- Xaa at position 23 is Phe, Ser, Pro, Trp, or Ile;
- Xaa at position 24 is Asn, or Ala;
- Xaa at position 26 is Leu, Trp, or Arg;
- Xaa at position 27 is Asn, Cys, Arg, Leu, His, Met, Pro;
- 10 Xaa at position 28 is Gly, Asp, Ser, Cys, Ala, Lys, Asn, Thr, Leu, Val, Glu, Phe, Tyr, Ile or Met;
- Xaa at position 29 is Glu, Asn, Tyr, Leu, Phe, Asp, Ala, Cys, Gln, Arg, Thr, Gly or Ser;
- Xaa at position 30 is Asp, Ser, Leu, Arg, Lys, Thr, Met, Trp, Glu,
- 15 Asn, Gln, Ala or Pro;
- Xaa at position 31 is Gln, Pro, Phe, Val, Met, Leu, Thr, Lys, Asp, Asn, Arg, Ser, Ala, Ile, Glu, His or Trp;
- Xaa at position 32 is Asp, Phe, Ser, Thr, Cys, Glu, Asn, Gln, Lys, His, Ala, Tyr, Ile, Val or Gly;
- 20 Xaa at position 33 is Ile, Gly, Val, Ser, Arg, Pro, or His;
- Xaa at position 34 is Leu, Ser, Cys, Arg, Ile, His, Phe, Glu, Lys, Thr, Ala, Met, Val or Asn;
- Xaa at position 35 is Met, Arg, Ala, Gly, Pro, Asn, His, or Asp;
- Xaa at position 36 is Glu, Leu, Thr, Asp, Tyr, Lys, Asn, Ser, Ala,
- 25 Ile, Val, His, Phe, Met or Gln;
- Xaa at position 37 is Asn, Arg, Met, Pro, Ser, Thr, or His;
- Xaa at position 38 is Asn, His, Arg, Leu, Gly, Ser, or Thr;
- Xaa at position 39 is Leu, Thr, Ala, Gly, Glu, Pro, Lys, Ser, Met, or;
- 30 Xaa at position 40 is Arg, Asp, Ile, Ser, Val, Thr, Gln, Asn, Lys, His, Ala or Leu;
- Xaa at position 41 is Arg, Thr, Val, Ser, Leu, or Gly;
- Xaa at position 42 is Pro, Gly, Cys, Ser, Gln, Glu, Arg, His, Thr, Ala, Tyr, Phe, Leu, Val or Lys;
- 35 Xaa at position 43 is Asn or Gly;
- Xaa at position 44 is Leu, Ser, Asp, Arg, Gln, Val, or Cys;
- Xaa at position 45 is Glu, Tyr, His, Leu, Pro, or Arg;
- Xaa at position 46 is Ala, Ser, Pro, Tyr, Asn, or Thr;

- Xaa at position 47 is Phe, Asn, Glu, Pro, Lys, Arg, or Ser;
Xaa at position 48 is Asn, His, Val, Arg, Pro, Thr, Asp, or Ile;
Xaa at position 49 is Arg, Tyr, Trp, Lys, Ser, His, Pro, or Val;
Xaa at position 50 is Ala, Asn, Pro, Ser, or Lys;
- 5 Xaa at position 51 is Val, Thr, Pro, His, Leu, Phe, or Ser;
Xaa at position 52 is Lys, Ile, Arg, Val, Asn, Glu, or Ser;
Xaa at position 53 is Ser, Ala, Phe, Val, Gly, Asn, Ile, Pro, or
His;
- Xaa at position 54 is Leu, Val, Trp, Ser, Ile, Phe, Thr, or His;
- 10 10 Xaa at position 55 is Gln, Ala, Pro, Thr, Glu, Arg, Trp, Gly, or
Leu;
- Xaa at position 56 is Asn, Leu, Val, Trp, Pro, or Ala;
Xaa at position 57 is Ala, Met, Leu, Pro, Arg, Glu, Thr, Gln,
Trp, or Asn;
- 15 15 Xaa at position 58 is Ser, Glu, Met, Ala, His, Asn, Arg, or Asp;
Xaa at position 59 is Ala, Glu, Asp, Leu, Ser, Gly, Thr, or Arg;
Xaa at position 60 is Ile, Met, Thr, Pro, Arg, Gly, Ala;
Xaa at position 61 is Glu, Lys, Gly, Asp, Pro, Trp, Arg, Ser,
Gln, or Leu;
- 20 20 Xaa at position 62 is Ser, Val, Ala, Asn, Trp, Glu, Pro, Gly, or
Asp;
- Xaa at position 63 is Ile, Ser, Arg, Thr, or Leu;
Xaa at position 64 is Leu, Ala, Ser, Glu, Phe, Gly, or Arg;
Xaa at position 65 is Lys, Thr, Gly, Asn, Met, Arg, Ile, or
- 25 25 Asp;
- Xaa at position 66 is Asn, Trp, Val, Gly, Thr, Leu, Glu, or Arg;
Xaa at position 67 is Leu, Gln, Gly, Ala, Trp, Arg, Val, or Lys;
Xaa at position 68 is Leu, Gln, Lys, Trp, Arg, Asp, Glu, Asn,
His, Thr, Ser, Ala, Tyr, Phe, Ile, Met or Val;
- 30 30 Xaa at position 69 is Pro, Ala, Thr, Trp, Arg, or Met;
Xaa at position 70 is Cys, Glu, Gly, Arg, Met, or Val;
Xaa at position 71 is Leu, Asn, Val, or Gln;
- Xaa at position 72 is Pro, Cys, Arg, Ala, or Lys;
- Xaa at position 73 is Leu, Ser, Trp, or Gly;
- 35 35 Xaa at position 74 is Ala, Lys, Arg, Val, or Trp;
Xaa at position 75 is Thr, Asp, Cys, Leu, Val, Glu, His, Asn, or
Ser;
- Xaa at position 76 is Ala, Pro, Ser, Thr, Gly, Asp, Ile, or Met;

- Xaa at position 77 is Ala, Pro, Ser, Thr, Phe, Leu, Asp, or His;
Xaa at position 78 is Pro, Phe, Arg, Ser, Lys, His, Ala, Gly, Ile
or Leu;
- Xaa at position 79 is Thr, Asp, Ser, Asn, Pro, Ala, Leu, or Arg;
- 5 Xaa at position 80 is Arg, Ile, Ser, Glu, Leu, Val, Gln, Lys, His,
Ala or Pro;
- Xaa at position 81 is His, Gln, Pro, Arg, Val, Leu, Gly, Thr, Asn,
Lys, Ser, Ala, Trp, Phe, Ile or Tyr;
- Xaa at position 82 is Pro, Lys, Tyr, Gly, Ile, or Thr;
- 10 Xaa at position 83 is Ile, Val, Lys, Ala, or Asn;
- Xaa at position 84 is His, Ile, Asn, Leu, Asp, Ala, Thr, Glu,
Gln, Ser, Phe, Met, Val, Lys, Arg, Tyr or Pro;
- Xaa at position 85 is Ile, Leu, Arg, Asp, Val, Pro, Gln,
Gly, Ser, Phe, or His;
- 15 Xaa at position 86 is Lys, Tyr, Leu, His, Arg, Ile, Ser, Gln,
Pro;
- Xaa at position 87 is Asp, Pro, Met, Lys, His, Thr, Val,
Tyr, Glu, Asn, Ser, Ala, Gly, Ile, Leu or Gln;
- Xaa at position 88 is Gly, Leu, Glu, Lys, Ser, Tyr, or Pro;
- 20 Xaa at position 89 is Asp, or Ser;
- Xaa at position 90 is Trp, Val, Cys, Tyr, Thr, Met, Pro, Leu,
Gln, Lys, Ala, Phe, or Gly;
- Xaa at position 91 is Asn, Pro, Ala, Phe, Ser, Trp, Gln, Tyr,
Leu, Lys, Ile, Asp, or His;
- 25 Xaa at position 92 is Glu, Ser, Ala, Lys, Thr, Ile, Gly, or Pro;
- Xaa at position 94 is Arg, Lys, Asp, Leu, Thr, Ile, Gln,
His, Ser, Ala, or Pro;
- Xaa at position 95 is Arg, Thr, Pro, Glu, Tyr, Leu, Ser, or Gly;
- Xaa at position 96 is Lys, Asn, Thr, Leu, Gln, Arg,
- 30 His, Glu, Ser, Ala or Trp;
- Xaa at position 97 is Leu, Ile, Arg, Asp, or Met;
- Xaa at position 98 is Thr, Val, Gln, Tyr, Glu, His, Ser, or Phe;
- Xaa at position 99 is Phe, Ser, Cys, His, Gly, Trp, Tyr, Asp,
Lys, Leu, Ile, Val or Asn;
- 35 Xaa at position 100 is Tyr, Cys, His, Ser, Trp, Arg, or Leu;
- Xaa at position 101 is Leu, Asn, Val, Pro, Arg, Ala, His, Thr,
Trp, or Met;
- Xaa at position 102 is Lys, Leu, Pro, Thr, Met, Asp, Val, Glu, Arg,

30

Trp, Ser, Asn, His, Ala, Tyr, Phe, Gln, or Ile;
Xaa at position 103 is Thr, Ser, Asn, Ile, Trp, Lys, or Pro;
Xaa at position 104 is Leu, Ser, Pro, Ala, Glu, Cys, Asp, or Tyr;
Xaa at position 105 is Glu, Ser, Lys, Pro, Leu, Thr, Tyr, or Arg;
5 Xaa at position 106 is Asn, Ala, Pro, Leu, His, Val, or Gln;
Xaa at position 107 is Ala, Ser, Ile, Asn, Pro, Lys, Asp, or
Gly;
Xaa at position 108 is Gln, Ser, Met, Trp, Arg, Phe, Pro, His,
Ile, Tyr, or Cys;
10 Xaa at position 109 is Ala, Met, Glu, His, Ser, Pro, Tyr, or Leu;

and which can additionally have Met- or Met-Ala- preceding the amino acid in position 1; and wherein from one to three of the amino acids designated by Xaa are different from the corresponding native amino acids of (1-133) human interleukin-3; or a polypeptide having substantially the same structure and substantially the same biological activity.

Included in the present invention are (15-125)hIL-3
20 mutant polypeptides of the Formula VI:

Asn Cys Xaa Xaa Xaa Xaa Glu Xaa Xaa Xaa Xaa Leu Xaa Xaa

5 Xaa Xaa Xaa Xaa Gln Gln [SEQ ID NO:20]

110

wherein

- Xaa at position 3 is Ser, Gly, Asp, Met, or Gln;
Xaa at position 4 is Asn, His, Leu, Ile, Phe, Arg, or Gln;
- 10 Xaa at position 5 is Met, Phe, Ile, Arg, or Ala;
Xaa at position 6 is Ile or Pro;
Xaa at position 7 is Asp, or Glu;
Xaa at position 9 is Ile, Val, Ala, Leu, or Gly;
Xaa at position 10 is Ile, Val, Phe, or Leu;
- 15 Xaa at position 11 is Thr, His, Gly, Gln, Arg, Pro, or Ala;
Xaa at position 12 is His, Phe, Gly, Arg, or Ala;
Xaa at position 14 is Lys, Leu, Gln, Gly, Pro, or Val;
Xaa at position 15 is Gln, Asn, Leu, Arg, or Val;
Xaa at position 16 is Pro, His, Thr, Gly, or Gln;
- 20 Xaa at position 17 is Pro, Asp, Gly, Ala, Arg, Leu, or Gln;
Xaa at position 18 is Leu, Arg, Gln, Asn, Gly, Ala, or Glu;
Xaa at position 19 is Pro, Leu, Gln, Ala, or Glu;
Xaa at position 20 is Leu, Val, Gly, Ser, Lys, Ala, Arg, Gln,
Glu, Ile, Phe, Thr or Met;
- 25 Xaa at position 21 is Leu, Ala, Asn, Pro, Gln, or Val;
Xaa at position 22 is Asp or Leu;
Xaa at position 23 is Phe, Ser, Pro, Trp, or Ile;
Xaa at position 24 is Asn or Ala;
Xaa at position 27 is Asn, Cys, Arg, His, Met, or Pro;
- 30 Xaa at position 28 is Gly, Asp, Ser, Cys, Ala, Asn, Ile, Leu,
Met, Tyr, or Arg;
Xaa at position 30 is Asp, or Glu;
Xaa at position 31 is Gln, Val, Met, Leu, Thr, Lys, Ala, Asn Glu,
Ser or Trp;
- 35 Xaa at position 32 is Asp, Phe, Ser, Thr, Cys, Ala, Asn, Gln,
Glu, His, Ile, Lys, Tyr, Val or Gly;
Xaa at position 33 is Ile, Val, or His;
Xaa at position 35 is Met, Asn, or Asp;

Xaa at position 36 is Glu, Thr, Ala, Asn, Ser or Asp;
Xaa at position 37 is Asn, Arg, Met, Pro, Ser, Thr, or His;
Xaa at position 38 is Asn or Gly;
Xaa at position 39 is Leu, Met, or Phe;

5 Xaa at position 40 is Arg, Ala or Ser;
Xaa at position 41 is Arg, Thr, Val, Leu, or Gly;
Xaa at position 42 is Pro, Gly, Cys, Ser, Gln, Ala, Arg, Asn,
Glu, His, Leu, Thr, Val or Lys;
Xaa at position 45 is Glu, Tyr, His, Leu, or Arg;

10 Xaa at position 46 is Ala, Ser, Asn, or Thr;
Xaa at position 47 is Phe or Ser;
Xaa at position 48 is Asn, Val, Pro, Thr, or Ile;
Xaa at position 49 is Arg, Tyr, Lys, Ser, His, or Val;
Xaa at position 50 is Ala or Asn;

15 Xaa at position 51 is Val, Thr, Leu, or Ser;
Xaa at position 52 is Lys, Ile, Arg, Val, Asn, Glu, or Ser;
Xaa at position 53 is Ser, Phe, Val, Gly, Asn, Ile, or His;
Xaa at position 54 is Leu, Val, Ile, Phe, or His;
Xaa at position 55 is Gln, Ala, Pro, Thr, Glu, Arg, or Gly;

20 Xaa at position 56 is Asn or Pro;
Xaa at position 57 is Ala, Met, Pro, Arg, Glu, Thr, or Gln;
Xaa at position 58 is Ser, Glu, Met, Ala, His, Asn, Arg, or Asp;
Xaa at position 59 is Ala, Glu, Asp, Leu, Ser, Gly, Thr, Arg, or
Pro;

25 Xaa at position 60 is Ile or Met;
Xaa at position 61 is Glu, Gly, Asp, Ser, or Gln;
Xaa at position 62 is Ser, Val, Ala, Asn, Glu, Pro, Gly, or
Asp;
Xaa at position 63 is Ile, Ser, or Leu;

30 Xaa at position 65 is Lys, Thr, Gly, Asn, Met, Arg, Ile, or
Asp;
Xaa at position 66 is Asn, Val, Gly, Thr, Leu, Glu, or Arg;
Xaa at position 67 is Leu, or Val;
Xaa at position 68 is Leu, Gln, Trp, Arg, Asp, Ala, Asn, Glu,

35 His, Met, Phe, Ser, Thr, Tyr or Val;
Xaa at position 69 is Pro, Ala, Thr, Trp, or Met;
Xaa at position 71 is Leu or Val;
Xaa at position 73 is Leu or Ser;

Xaa at position 74 is Ala, Arg, or Trp;
Xaa at position 75 is Thr, Asp, Glu, His, Asn, or Ser;
Xaa at position 76 is Ala, Asp, or Met;
Xaa at position 77 is Ala, Pro, Ser, Thr, Phe, Leu, or Asp;

5 Xaa at position 78 is Pro or Ser;
Xaa at position 79 is Thr, Asp, Ser, Pro, Ala, Leu, or Arg;
Xaa at position 81 is His, Pro, Arg, Val, Leu, Gly, Asn, Ile, Phe,
Ser or Thr;
Xaa at position 82 is Pro or Tyr;

10 Xaa at position 83 is Ile, Val, or Ala;
Xaa at position 84 is His, Ile, Asn, Leu, Asp, Ala, Thr,
Arg, Gln, Glu, Lys, Met, Ser, Tyr, Val or Pro;
Xaa at position 85 is Ile, Leu, Val, or Phe;
Xaa at position 86 is Lys, Leu, His, Arg, Ile, Gln, Pro or

15 Ser;
Xaa at position 87 is Asp, Pro, Met, Lys, His, Thr, Val,
Asn, Ile, Leu or Tyr;
Xaa at position 88 is Gly, Glu, Lys, or Ser;
Xaa at position 90 is Trp, Val, Tyr, Met, or Leu;

20 Xaa at position 91 is Asn, Pro, Ala, Phe, Ser, Trp, Gln, Tyr,
Leu, Lys, Ile, Asp, or His;
Xaa at position 92 is Glu, Ser, Ala, or Gly;
Xaa at position 94 is Arg, Ala, Gln, Ser or Lys;
Xaa at position 95 is Arg, Thr, Glu, Leu, Ser, or Gly;

25 Xaa at position 98 is Thr, Val, Gln, Glu, His, or Ser;
Xaa at position 100 is Tyr or Trp;
Xaa at position 101 is Leu or Ala;
Xaa at position 102 is Lys, Thr, Met, Val, Trp, Ser, Leu,
Ala, Asn, Gln, His, Met, Phe, Tyr or Ile;

30 Xaa at position 103 is Thr, Ser, or Asn;
Xaa at position 105 is Glu, Ser, Pro, Leu, Thr, or Tyr;
Xaa at position 106 is Asn, Pro, Leu, His, Val, or Gln;
Xaa at position 107 is Ala, Ser, Ile, Asn, Pro, Lys, Asp, or

Gly;

35 Xaa at position 108 is Gln, Ser, Met, Trp, Arg, Phe, Pro, His,
Ile, Tyr, or Cys;
Xaa at position 109 is Ala, Met, Glu, His, Ser, Pro, Tyr, or Leu;

and which can additionally have Met- or Met-Ala- preceding the amino acid in position 1; and wherein from one to three of the amino acids designated by Xaa are different from the corresponding amino acids of native (1-133) human interleukin-3; or a polypeptide 5 having substantially the same structure and substantially the same biological activity.

Included in the present invention are (15-125)hIL-3 mutant polypeptides of the Formula VII:

wherein

- Xaa at position 3 is Ser, Gly, Asp, or Gln;
- Xaa at position 4 is Asn, His, or Ile;
- Xaa at position 9 is Ile, Ala, Leu, or Gly;
- 5 Xaa at position 11 is Thr, His, or Gln;
- Xaa at position 12 is His or Ala;
- Xaa at position 15 is Gln or Asn;
- Xaa at position 16 is Pro or Gly;
- Xaa at position 18 is Leu, Arg, Asn, or Ala;
- 10 Xaa at position 20 is Leu, Val, Ser, Ala, Arg, Gln, Glu, Ile, Phe, Thr or Met;
- Xaa at position 21 is Leu, Ala, Asn, or Pro;
- Xaa at position 24 is Asn or Ala;
- Xaa at position 28 is Gly, Asp, Ser, Ala, Asn, Ile, Leu, Met,
- 15 Tyr or Arg;
- Xaa at position 31 is Gln, Val, Met, Leu, Ala, Asn, Glu or Lys;
- Xaa at position 32 is Asp, Phe, Ser, Ala, Gln, Glu, His, Val or Thr;
- Xaa at position 36 is Glu, Asn, Ser or Asp;
- 20 Xaa at position 37 is Asn, Arg, Pro, Thr, or His;
- Xaa at position 41 is Arg, Leu, or Gly;
- Xaa at position 42 is Pro, Gly, Ser, Ala, Asn, Val, Leu or Gln;
- Xaa at position 48 is Asn, Pro, or Thr;
- Xaa at position 50 is Ala or Asn;
- 25 Xaa at position 51 is Val or Thr;
- Xaa at position 53 is Ser or Phe;
- Xaa at position 54 is Leu or Phe;
- Xaa at position 55 is Gln, Ala, Glu, or Arg;
- Xaa at position 62 is Ser, Val, Asn, Pro, or Gly;
- 30 Xaa at position 63 is Ile or Leu;
- Xaa at position 65 is Lys, Asn, Met, Arg, Ile, or Gly;
- Xaa at position 66 is Asn, Gly, Glu, or Arg;
- Xaa at position 68 is Leu, Gln, Trp, Arg, Asp, Asn, Glu, His, Met, Phe, Ser, Thr, Tyr or Val;
- 35 Xaa at position 73 is Leu or Ser;
- Xaa at position 74 is Ala or Trp;
- Xaa at position 77 is Ala or Pro;
- Xaa at position 79 is Thr, Asp, or Ala;

Xaa at position 81 is His, Pro, Arg, Val, Gly, Asn, Ser or Thr;
Xaa at position 84 is His, Ile, Asn, Ala, Thr, Arg, Gln, Glu,
Lys, Met, Ser, Tyr, Val or Leu;
Xaa at position 85 is Ile or Leu;
5 Xaa at position 86 is Lys or Arg;
Xaa at position 87 is Asp, Pro, Met, Lys, His, Pro, Asn, Ile, Leu
or Tyr;
Xaa at position 91 is Asn, Pro, Ser, Ile or Asp;
Xaa at position 94 is Arg, Ala, or Ser;
10 Xaa at position 95 is Arg, Thr, Glu, Leu, or Ser;
Xaa at position 98 is Thr or Gln;
Xaa at position 102 is Lys, Val, Trp, or Ile;
Xaa at position 103 is Thr, Ala, His, Phe, Tyr or Ser;
Xaa at position 106 is Asn, Pro, Leu, His, Val, or Gln;
15 Xaa at position 107 is Ala, Ser, Ile, Pro, or Asp;
Xaa at position 108 is Gln, Met, Trp, Phe, Pro, His, Ile, or Tyr;
Xaa at position 109 is Ala, Met, Glu, Ser, or Leu;

and which can additionally have Met- or Met-Ala- preceding the
20 amino acid in position 1; and wherein from one to three of the
amino acids designated by Xaa are different from the corresponding
amino acids of native (1-133)human interleukin-3; or a polypeptide
having substantially the same structure and substantially the same
biological activity.

25

In Formulas V, VI, VII and VIII the Asn in position
1 corresponds to the Asn in position 15 of native hIL-3
and positions 1 to 111 correspond to positions 15 to 125
in the native hIL-3 sequence shown in Figure 1.

30

Also included in the present invention are
polypeptides of the following formula (IX):

	1	5	10
	(Met) _m -Ala Pro Met Thr Gln Thr Thr Ser Leu Lys Thr		
35	15	20	
	Ser Trp Val Asn Cys Ser Xaa Met Ile Asp Glu Ile Ile		
25	30	35	
	Xaa His Leu Lys Xaa Pro Pro Xaa Pro Leu Leu Asp Xaa

	Ser Leu Ala Ile Phe [SEQ ID NO:129]		

wherein m is 0 or 1; Xaa at position 18 is Asn or Ile;
Xaa at position 25 is Thr or His; Xaa at position 29 is
20 Gln, Arg, or Val; Xaa at position 32 is Leu, Ala, or Asn;
Xaa at position 37 is Phe, Pro, or Ser; Xaa at position
42 is Glu, Ala, or Ser; Xaa at position 45 is Gln, Val,
or Met; Xaa at position 51 is Asn or Arg; Xaa at position
55 is Arg, Leu, or Thr; Xaa at position 59 is Glu or Leu;
25 Xaa at position 60 is Ala or Ser; Xaa at position 62 is
Asn or Val; Xaa at position 67 is Ser, Asn, or His; Xaa
at position 69 is Gln or Glu; Xaa at position 73 is Ala
or Gly; Xaa at position 76 is Ser or Ala; Xaa at position
79 is Lys or Arg; Xaa at position 82 is Leu, Glu, or Val;
30 Xaa at position 87 is Leu or Ser; Xaa at position 93 is
Pro or Ser; Xaa at position 98 is His, Ile, or Thr; Xaa
at position 101 is Asp or Ala; Xaa at position 105 is Asn
or Glu; Xaa at position 109 is Arg or Glu; Xaa at
position 116 is Lys or Val; Xaa at position 120 is Asn,
35 Gln, or His; Xaa at position 123 is Ala or Glu; wherein
from one to three of the amino acids designated by Xaa
are different from the corresponding amino acids of
native human interleukin-3; or a polypeptide having

substantially the same structure and substantially the same biological activity.

Polypeptides of the present invention include those
5 (15-125)hIL-3 muteins of the following formula (X):

	1	5	10
	(Met _m -Alan) _p -Asn Cys Ser Xaa Met Ile Asp Glu Ile Ile		
	15	20	
	Xaa His Leu Lys Xaa Pro Pro Xaa Pro Leu Leu Asp Xaa

	Asp Trp Xaa Glu Phe Arg Xaa Lys Leu Thr Phe Tyr Leu		
	105	110	
	Xaa Thr Leu Glu Xaa Ala Gln Xaa Gln Gln [SEQ ID NO:130]		

25 wherein m is 0 or 1; n is 0 or 1; p is 0 or 1; Xaa at position 4 is Asn or Ile; Xaa at position 11 is Thr or His; Xaa at position 15 is Gln, Arg, or Val; Xaa at position 18 is Leu, Ala, or Asn; Xaa at position 23 is Phe, Pro, or Ser; Xaa at position 28 is Glu, Ala, or Ser; 30 Xaa at position 31 is Gln, Val, or Met; Xaa at position 37 is Asn or Arg; Xaa at position 41 is Arg, Leu, or Thr; Xaa at position 45 is Glu or Leu; Xaa at position 46 is Ala or Ser; Xaa at position 48 is Asn or Val; Xaa at position 53 is Ser, Asn, or His; Xaa at position 55 is 35 Gln or Glu; Xaa at position 59 is Ala or Gly; Xaa at position 62 is Ser or Ala; Xaa at position 65 is Lys or Arg; Xaa at position 68 is Leu, Glu, or Val; Xaa at position 73 is Leu or Ser; Xaa at position 79 is Pro or

Ser; Xaa at position 84 is His, Ile, or Thr; Xaa at position 87 is Asp or Ala; Xaa at position 91 is Asn or Glu; Xaa at position 95 is Arg or Glu; Xaa at position 102 is Lys or Val; Xaa at position 106 is Asn, Gln, or 5 His; Xaa at position 109 is Ala or Glu;

wherein from one to three of the amino acids designated by Xaa are different from the corresponding amino acids of native (15-125)human interleukin-3; or a polypeptide 10 having substantially the same structure and substantially the same biological activity.

The present invention includes polypeptides of Formula IX and Formula X above wherein from one to three 15 of the amino acids designated by Xaa are different from the corresponding amino acids of native human interleukin-3 or native (15-125) human interleukin-3; or a polypeptide having substantially the same structure and substantially the same biological activity.

20 "Mutant amino acid sequence," "mutant protein" or "mutant polypeptide" refers to a polypeptide having an amino acid sequence which varies from a native sequence or is encoded by a nucleotide sequence intentionally made 25 variant from a native sequence. "Mutant protein," "variant protein" or "mutein" means a protein comprising a mutant amino acid sequence and includes polypeptides which differ from the amino acid sequence of native hIL-3 due to amino acid deletions, substitutions, or both. 30 "Native sequence" refers to an amino acid or nucleic acid sequence which is identical to a wild-type or native form of a gene or protein.

Human IL-3 can be characterized by its ability to 35 stimulate colony formation by human hematopoietic progenitor cells. The colonies formed include erythroid, granulocyte, megakaryocyte, granulocytic macrophages and mixtures thereof. Human IL-3 has demonstrated an ability

to restore bone marrow function and peripheral blood cell populations to therapeutically beneficial levels in studies performed initially in primates and subsequently in humans (Gillio, A. P., et al. (1990); Ganser, A., et al. (1990); Falk, S., et al. (1991). Additional activities of hIL-3 include the ability to stimulate leukocyte migration and chemotaxis; the ability to prime human leukocytes to produce high levels of inflammatory mediators like leukotrienes and histamine; the ability to induce cell surface expression of molecules needed for leukocyte adhesion; and the ability to trigger dermal inflammatory responses and fever. Many or all of these biological activities of hIL-3 involve signal transduction and high affinity receptor binding. Mutant polypeptides of the present invention may exhibit useful properties such as having similar or greater biological activity when compared to native hIL-3 or by having improved half-life or decreased adverse side effects, or a combination of these properties. They may also be useful as antagonists. hIL-3 mutant polypeptides which have little or no activity when compared to native hIL-3 may still be useful as antagonists, as antigens for the production of antibodies for use in immunology or immunotherapy, as genetic probes or as intermediates used to construct other useful hIL-3 muteins. Since hIL-3 functions by binding to its receptor(s) and triggering second messages resulting in competent signal transduction, hIL-3 muteins of this invention may be useful in helping to determine which specific amino acid sequences are responsible for these activities.

The novel hIL-3 mutant polypeptides of the present invention will preferably have at least one biological property of human IL-3 or of an IL-3-like growth factor and may have more than one IL-3-like biological property, or an improved property, or a reduction in an undesirable biological property of human IL-3. Some mutant polypeptides of the present invention may also exhibit an

improved side effect profile. For example, they may exhibit a decrease in leukotriene release or histamine release when compared to native hIL-3 or (15-125) hIL-3. Such hIL-3 or hIL-3-like biological properties may 5 include one or more of the following biological characteristics and in vivo and in vitro activities.

One such property is the support of the growth and differentiation of progenitor cells committed to 10 erythroid, lymphoid, and myeloid lineages. For example, in a standard human bone marrow assay, an IL-3-like biological property is the stimulation of granulocytic type colonies, megakaryocytic type colonies, monocyte/macrophage type colonies, and erythroid bursts. 15 Other IL-3-like properties are the interaction with early multipotential stem cells, the sustaining of the growth of pluripotent precursor cells, the ability to stimulate chronic myelogenous leukemia (CML) cell proliferation, the stimulation of proliferation of mast cells, the 20 ability to support the growth of various factor-dependent cell lines, and the ability to trigger immature bone marrow cell progenitors. Other biological properties of IL-3 have been disclosed in the art. Human IL-3 also has some biological activities which may in some cases be 25 undesirable, for example the ability to stimulate leukotriene release and the ability to stimulate increased histamine synthesis in spleen and bone marrow cultures and in vivo.

30 Biological activity of hIL-3 and hIL-3 mutant proteins of the present invention is determined by DNA synthesis by human acute myelogenous leukemia cells (AML). The factor-dependent cell line AML 193 was adapted for use in testing biological activity.

35

One object of the present invention is to provide hIL-3 muteins and hIL-3 deletion muteins with one or more amino acid substitutions in the polypeptide sequence

which have similar or improved biological activity in relation to native hIL-3 or native (15-125)hIL-3.

The present invention includes mutant polypeptides comprising minimally amino acid residues 15 to 118 of hIL-3 with or without additional amino acid extensions to the N-terminus and/or C-terminus which further contain from one to three or more amino acid substitutions in the amino acid sequence of the polypeptide. It has been found that the (15-125)hIL-3 mutant is more soluble than is hIL-3 when expressed in the cytoplasm of *E. coli*, and the protein is secreted to the periplasm in *E. coli* at higher levels compared to native hIL-3.

When expressed in the *E. coli* cytoplasm, the above-mentioned mutant hIL-3 polypeptides of the present invention may also be constructed with Met-Ala- at the N-terminus so that upon expression the Met is cleaved off leaving Ala at the N-terminus. These mutant hIL-3 polypeptides may also be expressed in *E. coli* by fusing a signal peptide to the N-terminus. This signal peptide is cleaved from the polypeptide as part of the secretion process. Secretion in *E. coli* can be used to obtain the correct amino acid at the N-terminus (e.g., Asn¹⁵ in the (15-125) hIL-3 polypeptide) due to the precise nature of the signal peptidase. This is in contrast to the heterogeneity often observed at the N-terminus of proteins expressed in the cytoplasm in *E. coli*.

The hIL-3 mutant polypeptides of the present invention may have hIL-3 or hIL-3-like activity. For example, they may possess one or more of the biological activities of native hIL-3 and may be useful in stimulating the production of hematopoietic cells by human or primate progenitor cells. The hIL-3 mutants of the present invention and pharmaceutical compositions containing them may be useful in the treatment of conditions in which hematopoietic cell populations have

been reduced or destroyed due to disease or to treatments such as radiation or chemotherapy.

hIL-3 muteins of the present invention may also be
5 useful as antagonists which block the hIL-3 receptor by binding specifically to it and preventing binding of the agonist.

One potential advantage of the (15-125) hIL-3
10 muteins of the present invention, particularly those which retain activity similar to or better than that of native hIL-3, is that it may be possible to use a smaller amount of the biologically active mutein to produce the desired therapeutic effect. This may make it possible to
15 reduce the number of treatments necessary to produce the desired therapeutic effect. The use of smaller amounts may also reduce the possibility of any potential antigenic effects or other possible undesirable side effects. For example, if a desired therapeutic effect
20 can be achieved with a smaller amount of polypeptide it may be possible to reduce or eliminate side effects associated with the administration of native IL-3 such as the stimulation of leukotriene and/or histamine release.
The hIL-3 muteins of the present invention may also be
25 useful in the activation of stem cells or progenitors which have low receptor numbers. Pharmaceutical compositions containing hIL-3 muteins of the present invention can be administered parenterally, intravenously, or subcutaneously.

30 In variants which contain an additional cysteine the presence of the cysteine permits the labeling of the protein with ricin which permits targeting ricin and other toxins or tracers using a sulfhydryl linkage to the
35 hIL-3 receptor.

As another aspect of the present invention, there is provided a novel method for producing the novel family of

human IL-3 muteins. The method of the present invention involves culturing a suitable cell or cell line, which has been transformed with a vector containing a DNA sequence coding for expression of a novel hIL-3 mutant polypeptide. Suitable cells or cell lines may be bacterial cells. For example, the various strains of *E-coli* are well-known as host cells in the field of biotechnology. Examples of such strains include *E. coli* strains JM101 [Yanish-Perron, et al. (1985)] and MON105 [Obukowicz, et al. (1992)]. Various strains of *B subtilis* may also be employed in this method. Many strains of yeast cells known to those skilled in the art are also available as host cells for expression of the polypeptides of the present invention.

Also suitable for use in the present invention are mammalian cells, such as Chinese hamster ovary cells (CHO). General methods for expression of foreign genes in mammalian cells are reviewed in: Kaufman, R. J. (1987) High level production of proteins in mammalian cells, in Genetic Engineering, Principles and Methods, Vol. 9, J. K. Setlow, editor, Plenum Press, New York. An expression vector is constructed in which a strong promoter capable of functioning in mammalian cells drives transcription of a eukaryotic secretion signal peptide coding region, which is translationally fused to the coding region for the hIL-3 variant. For example, plasmids such as pCDNA I/Neo, pRc/RSV, and pRc/CMV (obtained from Invitrogen Corp., San Diego, California) can be used. The eukaryotic secretion signal peptide coding region can be from the hIL-3 gene itself or it can be from another secreted mammalian protein (Bayne, M. L. et al. (1987) Proc. Natl. Acad. Sci. USA 84, 2638-2642). After construction of the vector containing the hIL-3 variant gene, the vector DNA is transfected into mammalian cells. Such cells can be, for example, the COS7, HeLa, BHK, CHO, or mouse L lines. The cells can be cultured, for example, in DMEM media (JRH Scientific). The hIL-3

variant secreted into the media can be recovered by standard biochemical approaches following transient expression 24 - 72 hours after transfection of the cells or after establishment of stable cell lines following 5 selection for neomycin resistance. The selection of suitable mammalian host cells and methods for transformation, culture, amplification, screening and product production and purification are known in the art. See, e.g., Gething and Sambrook, Nature, 293:620-625 10 (1981), or alternatively, Kaufman et al, Mol. Cell. Biol., 5(7):1750-1759 (1985) or Howley et al., U.S. Pat. No. 4,419,446. Another suitable mammalian cell line is the monkey COS-1 cell line. A similarly useful mammalian cell line is the CV-1 cell line.

15 Where desired, insect cells may be utilized as host cells in the method of the present invention. See, e.g. Miller et al, Genetic Engineering, 8:277-298 (Plenum Press 1986) and references cited therein. In addition, 20 general methods for expression of foreign genes in insect cells using Baculovirus vectors are described in: Summers, M. D. and Smith, G. E. (1987) - A manual of methods for Baculovirus vectors and insect cell culture procedures, Texas Agricultural Experiment Station 25 Bulletin No. 1555. An expression vector is constructed comprising a Baculovirus transfer vector, in which a strong Baculovirus promoter (such as the polyhedron promoter) drives transcription of a eukaryotic secretion signal peptide coding region, which is translationally fused to the coding region for the hIL-3 variant 30 polypeptide. For example, the plasmid pVL1392 (obtained from Invitrogen Corp., San Diego, California) can be used. After construction of the vector carrying the hIL-3 variant gene, two micrograms of this DNA is 35 cotransfected with one microgram of Baculovirus DNA (see Summers & Smith, 1987) into insect cells, strain SF9. Pure recombinant Baculovirus carrying the hIL-3 variant is used to infect cells cultured, for example, in Excell

401 serum-free medium (JRH Biosciences, Lenexa, Kansas). The hIL-3 variant secreted into the medium can be recovered by standard biochemical approaches.

5 Another aspect of the present invention provides plasmid DNA vectors for use in the method of expression of these novel hIL-3 muteins. These vectors contain the novel DNA sequences described above which code for the novel polypeptides of the invention. Appropriate vectors
10 which can transform microorganisms capable of expressing the hIL-3 muteins include expression vectors comprising nucleotide sequences coding for the hIL-3 muteins joined to transcriptional and translational regulatory sequences which are selected according to the host cells used.

15 Vectors incorporating modified sequences as described above are included in the present invention and are useful in the production of the hIL-3 mutant polypeptides. The vector employed in the method also
20 contains selected regulatory sequences in operative association with the DNA coding sequences of the invention and capable of directing the replication and expression thereof in selected host cells.

25 The present invention also includes the construction and expression of (15-125)human interleukin-3 muteins having one or more amino acid substitutions in secretion vectors that optimize accumulation of correctly folded, active polypeptide. While many heterologous proteins
30 have been secreted in E. coli there is still a great deal of unpredictability and limited success (Stader and Silhavy 1990). Full-length hIL-3 is such a protein, where attempts to secrete the protein in E. coli resulted in low levels of secretion. Secretion of the variant
35 (15-125) hIL-3 mutant polypeptides of the present invention as a fusion with a signal peptide such as lamB results in correctly folded protein that can be removed from the periplasm of E. coli by osmotic shock

fractionation. This property of the variant (15-125) hIL-3 muteins allows for the direct and rapid screening for bioactivity of the secreted material in the crude osmotic shock fraction, which is a significant advantage.

5 Furthermore, it provides a means of using the (15-125) hIL-3 muteins to conduct structure activity relationship (SAR) studies of the hIL-3 molecule. A further advantage of secretion of (15-125) hIL-3 muteins fused to the lamB signal peptide is that the secreted
10 polypeptide has the correct N-terminal amino acid (Asn) due to the precise nature of the cleavage of the signal peptide by signal peptidase, as part of the secretion process.

15 The (15-125) hIL-3 muteins of the present invention may include hIL-3 polypeptides having Met-, Ala- or Met-Ala- attached to the N-terminus. When the muteins are expressed in *E. coli*, polypeptides with and without Met attached to the N-terminus are obtained. The methionine
20 can in some cases be removed by methionine aminopeptidase.

Amino terminal sequences of some of the hIL-3 muteins made in *E. coli* were determined using the method
25 described by Hunkapillar et al., (1983). It was found that hIL-3 proteins made in *E. coli* from genes encoding Met-(15-125) hIL-3 were isolated as Met-(15-125) hIL-3. Proteins produced from genes encoding Met-Ala-(15-125) hIL-3 were produced as Ala-(15-125) hIL-3. The N-termini
30 of proteins made in the cytoplasm of *E. coli* are affected by posttranslational processing by methionine aminopeptidase (Ben-Bassat et al., 1987) and possibly by other peptidases.

35 One method of creating the preferred hIL-3 (15-125) mutant genes is cassette mutagenesis [Wells, et al. (1985)] in which a portion of the coding sequence of hIL-3 in a plasmid is replaced with synthetic

oligonucleotides that encode the desired amino acid substitutions in a portion of the gene between two restriction sites. In a similar manner amino acid substitutions could be made in the full-length hIL-3 gene, or genes encoding variants of hIL-3 in which from 1 to 14 amino acids have been deleted from the N-terminus and/or from 1 to 15 amino acids have been deleted from the C-terminus. When properly assembled these oligonucleotides would encode hIL-3 variants with the desired amino acid substitutions and/or deletions from the N-terminus and/or C-terminus. These and other mutations could be created by those skilled in the art by other mutagenesis methods including; oligonucleotide-directed mutagenesis [Zoller and Smith (1982, 1983, 1984), Smith (1985), Kunkel (1985), Taylor, et al. (1985), Deng and Nickoloff (1992)] or polymerase chain reaction (PCR) techniques [Saiki, (1985)].

Pairs of complementary synthetic oligonucleotides encoding portions of the amino terminus of the hIL-3 gene can be made and annealed to each other. Such pairs would have protruding ends compatible with ligation to NcoI at one end. The NcoI site would include the codon for the initiator methionine. At the other end of oligonucleotide pairs, the protruding (or blunt) ends would be compatible with a restriction site that occurs within the coding sequence of the hIL-3 gene. The DNA sequence of the oligonucleotide would encode sequence for amino acids of hIL-3 with the exception of those substituted and/or deleted from the sequence.

The NcoI enzyme and the other restriction enzymes chosen should have recognition sites that occur only once in the DNA of the plasmid chosen. Plasmid DNA can be treated with the chosen restriction endonucleases then ligated to the annealed oligonucleotides. The ligated mixtures can be used to transform competent JM101 cells to resistance to an appropriate antibiotic. Single

colonies can be picked and the plasmid DNA examined by restriction analysis and/or DNA sequencing to identify plasmids with mutant hIL-3 genes.

5

One example of a restriction enzyme which cleaves within the coding sequence of the hIL-3 gene is Clal whose recognition site is at codons 20 and 21. The use of Clal to cleave the sequence of hIL-3 requires that the 10 plasmid DNA be isolated from an *E. coli* strain that fails to methylate adenines in the DNA at GATC recognition sites. This is because the recognition site for Clal, ATCGAT, occurs within the sequence GATCGAT which occurs at codons 19, 20 and 21 in the hIL-3 gene. The A in the 15 GATC sequence is methylated in most *E. coli* host cells. This methylation prevents Clal from cleaving at that particular sequence. An example of a strain that does not methylate adenines is GM48.

20 Interpretation of activity of single amino acid mutants in IL-3 (15-125)

As illustrated in Tables 6 and 9, there are certain positions in the IL-3 (15-125) molecule which are 25 intolerant of substitutions, in that most or all substitutions at these positions resulted in a considerable decrease in bioactivity. There are two likely classes of such "down-mutations": mutations that affect overall protein structure, and mutations that 30 interfere directly with the interaction between the IL-3 molecule and its receptor. Mutations affecting the three-dimensional structure of the protein will generally lie in the interior of the protein, while mutations affecting receptor binding will generally lie on the 35 surface of the protein. Although the three-dimensional structure of IL-3 is unknown, there are simple algorithms which can aid in the prediction of the structure. One such algorithm is the use of "helical wheels" (Kaiser,

53

E.T. & Kezdy, F.J., Science, 223:249-255 (1984)). In this method, the presence of alpha helical protein structures can be predicted by virtue of their amphipathic nature. Helices in globular proteins 5 commonly have an exposed hydrophilic side and a buried hydrophobic side. As a broad generalization, in globular proteins, hydrophobic residues are present in the interior of the protein, and hydrophilic residues are present on the surface. By displaying the amino acid 10 sequence of a protein on such a "helical wheel" it is possible to derive a model for which amino acids in alpha helices are exposed and which are buried in the core of the protein. Such an analysis of the IL-3 (15-125) molecule predicts that the following helical residues are 15 buried in the core:

M19, I20, I23, I24, L27, L58, F61, A64, L68, A71, I74, I77, L78, L81, W104, F107, L111, Y114, L115, L118.

20 In addition, cysteine residues at positions 16 and 84 are linked by a disulfide bond, which is important for the overall structure or "folding" of the protein. Finally, mutations which result in a major disruption of the protein structure may be expressed at low level in 25 the secretion system used in our study, for a variety of reasons: either because the mis-folded protein is poorly recognized by the secretion machinery of the cell; because mis-folding of the protein results in aggregation, and hence the protein cannot be readily 30 extracted from the cells; or because the mis-folded protein is more susceptible to degradation by cellular proteases. Hence, a block in secretion may indicate which positions in the IL-3 molecule which are important for maintenance of correct protein structure.

35

In order to retain the activity of a variant of IL-3, it is necessary to retain both the structural integrity of the protein, and retain the specific

residues important for receptor contact. Hence it is possible to define specific amino acid residues in IL-3 (15-125) which must be retained in order to preserve biological activity.

5

Residues predicted to be important for interaction with the receptor: D21, E22, E43, D44, L48, R54, R94, D103, K110, F113.

10

Residues predicted to be structurally important: C16, L58, F61, A64, I74, L78, L81, C84, P86, P92, P96, F107, L111, L115, L118.

15

The hIL-3 muteins of the present invention may be useful in the treatment of diseases characterized by a decreased levels of either myeloid, erythroid, lymphoid, or megakaryocyte cells of the hematopoietic system or combinations thereof. In addition, they may be used to activate mature myeloid and/or lymphoid cells. Among conditions susceptible to treatment with the polypeptides of the present invention is leukopenia, a reduction in the number of circulating leukocytes (white cells) in the peripheral blood. Leukopenia may be induced by exposure to certain viruses or to radiation. It is often a side effect of various forms of cancer therapy, e.g., exposure to chemotherapeutic drugs and of infection or hemorrhage. Therapeutic treatment of leukopenia with these hIL-3 mutant polypeptides of the present invention may avoid undesirable side effects caused by treatment with presently available drugs.

The hIL-3 muteins of the present invention may be useful in the treatment of neutropenia and, for example, in the treatment of such conditions as aplastic anemia, cyclic neutropenia, idiopathic neutropenia, Chdiak-Higashi syndrome, systemic lupus erythematosus (SLE), leukemia, myelodysplastic syndrome and myelofibrosis.

Many drugs may cause bone marrow suppression or hematopoietic deficiencies. Examples of such drugs are AZT, DDI, alkylating agents and anti-metabolites used in chemotherapy, antibiotics such as chloramphenicol, penicillin and sulfa drugs, phenothiazones, tranquilizers such as meprobamate, and diuretics. The hIL-3 muteins of the present invention may be useful in preventing or treating the bone marrow suppression or hematopoietic deficiencies which often occur in patients treated with these drugs.

Hematopoietic deficiencies may also occur as a result of viral, microbial or parasitic infections and as a result of treatment for renal disease or renal failure, e.g., dialysis. The hIL-3 muteins of the present invention may be useful in treating such hematopoietic deficiency.

The treatment of hematopoietic deficiency may include administration of the hIL-3 mutein of a pharmaceutical composition containing the hIL-3 mutein to a patient. The hIL-3 muteins of the present invention may also be useful for the activation and amplification of hematopoietic precursor cells by treating these cells in vitro with the muteins of the present invention prior to injecting the cells into a patient.

Various immunodeficiencies e.g., in T and/or B lymphocytes, or immune disorders, e.g., rheumatoid arthritis, may also be beneficially affected by treatment with the hIL-3 mutant polypeptides of the present invention. Immunodeficiencies may be the result of viral infections e.g. HTLVI, HTLVII, HTLVIII, severe exposure to radiation, cancer therapy or the result of other medical treatment. The hIL-3 mutant polypeptides of the present invention may also be employed, alone or in combination with other hematopoietins, in the treatment

of other blood cell deficiencies, including thrombocytopenia (platelet deficiency), or anemia. Other uses for these novel polypeptides are in the treatment of patients recovering from bone marrow transplants *in vivo* and *ex vivo*, and in the development of monoclonal and polyclonal antibodies generated by standard methods for diagnostic or therapeutic use.

Other aspects of the present invention are methods and therapeutic compositions for treating the conditions referred to above. Such compositions comprise a therapeutically effective amount of one or more of the hIL-3 muteins of the present invention in a mixture with a pharmaceutically acceptable carrier. This composition can be administered either parenterally, intravenously or subcutaneously. When administered, the therapeutic composition for use in this invention is preferably in the form of a pyrogen-free, parenterally acceptable aqueous solution. The preparation of such a parenterally acceptable protein solution, having due regard to pH, isotonicity, stability and the like, is within the skill of the art.

The dosage regimen involved in a method for treating the above-described conditions will be determined by the attending physician considering various factors which modify the action of drugs, e.g. the condition, body weight, sex and diet of the patient, the severity of any infection, time of administration and other clinical factors. Generally, a daily regimen may be in the range of 0.2 - 150 µg/kg of non-glycosylated IL-3 protein per kilogram of body weight. This dosage regimen is referenced to a standard level of biological activity which recognizes that native IL-3 generally possesses an EC₅₀ at or about 10 picoMolar to 100 picoMolar in the AML proliferation assay described herein. Therefore, dosages would be adjusted relative to the activity of a given mutein vs. the activity of native (reference) IL-3 and it

would not be unreasonable to note that dosage regimens may include doses as low as 0.1 microgram and as high as 1 milligram per kilogram of body weight per day. In addition, there may exist specific circumstances where 5 dosages of IL-3 mutein would be adjusted higher or lower than the range of 10 - 200 micrograms per kilogram of body weight. These include co-administration with other CSF or growth factors; co-administration with chemotherapeutic drugs and/or radiation; the use of 10 glycosylated IL-3 mutein; and various patient-related issues mentioned earlier in this section. As indicated above, the therapeutic method and compositions may also include co-administration with other human factors. A non-exclusive list of other appropriate hematopoietins, 15 CSFs and interleukins for simultaneous or serial co-administration with the polypeptides of the present invention includes GM-CSF, CSF-1, G-CSF, Meg-CSF, M-CSF, erythropoietin (EPO), IL-1, IL-4, IL-2, IL-5, IL-6, IL-7, IL-8, IL-9, IL-10, IL-11, LIF, B-cell growth factor, 20 B-cell differentiation factor and eosinophil differentiation factor, stem cell factor (SCF) also known as steel factor or c-kit ligand, or combinations thereof. The dosage recited above would be adjusted to compensate for such additional components in the therapeutic 25 composition. Progress of the treated patient can be monitored by periodic assessment of the hematological profile, e.g., differential cell count and the like.

Materials and methods for hIL-3 Mutein Expression in
30 E. coli

Unless noted otherwise, all specialty chemicals were obtained from Sigma Co., (St. Louis, MO). Restriction endonucleases, T4 poly-nucleotides kinase, E. coli DNA 35 polymerase I large fragment (Klenow) and T4 DNA ligase were obtained from New England Biolabs (Beverly, Massachusetts) or Boehringer Mannheim (Indianapolis, Indiana). All chemicals and enzymes were used according

to manufacturer's directions.

Escherichia coli strains

5 Strain JM101: delta (pro lac), supE, thi, F' (traD36,
proAB, lacI-Q, lacZdeltaM15) (Messing, 1979). This
strain can be obtained from the American Type Culture
Collection (ATCC), 12301 Parklawn Drive, Rockville,
Maryland 20852, accession number 33876. MON 105 (W3110
10 rpoH358) (Obukowicz, et al., 1992) is a derivative of
W3110 (Bachmann, 1972) and has been assigned ATCC
accession number 55204. Strain GM48: dam-3, dcm-6, gal,
ara, lac, thr, leu, tonA, tsx (Marinus, 1973) was used to
make plasmid DNA that is not methylated at the sequence
15 GATC.

Genes and plasmids

20 The gene used for hIL-3 production in *E. coli* was
obtained from British Biotechnology Incorporated,
Cambridge, England, catalogue number BBG14. This gene is
carried on a pUC based plasmid designated pP0518. The
human IL-3 gene sequence is from Yang, et al. (1986).

25 The plasmids used for production of hIL-3 in *E. coli*
contain genetic elements whose use has been described
(Olins et al., 1988; Olins and Rangwala, 1990). The
replicon used is that of pBR327 [(Bolivar et al. (1977);
Soberon et al., 1980] which is maintained at a copy
30 number of about 50 in the cell (Covarrubias, et al.,
(1981)). A gene encoding the beta-lactamase protein is
present on the plasmids. This protein confers ampicillin
resistance on the cell. This resistance serves as a
selectable phenotype for the presence of the plasmid in
35 the cell.

Intracellular expression plasmids: For cytoplasmic
(intracellular) expression vectors the transcription

promoter was derived from the recA gene of *E. coli* (Sancar et al., 1980). This promoter, designated *precA*, is contained on 72 base pairs (bp) *Bgl*II, *Bam*HI fragment which includes the RNA polymerase binding site and the 5 *lexA* repressor binding site (the operator). This segment of DNA provides high level transcription that is regulated even when the *recA* promoter is on a plasmid with the pBR327 origin of replication (Olins et al., 1988) incorporated herein by reference.

10

Secretion expression plasmids: In secretion expression plasmids the transcription promoter was derived from the *ara B*, *A*, and *D* genes of *E. coli* (Greenfield et al., 1978). This promoter is designated *pAraBAD* and is 15 contained on a 323 base pair *Sac*II, *Bgl*II restriction fragment. The *lamB* secretion leader (Wong et al., 1988, Clement et al., 1981) was fused to the N-terminus of the *hIL-3* gene at the recognition sequence for the enzyme *NcoI* (5'CCATGG3'). The *hIL-3* genes used were engineered 20 to have a *Hind*III recognition site (5'AAGCTT3') following the coding sequence of the gene. Downstream of the gene is a 550 bp fragment containing the origin of replication of the single stranded phage *f1* [Olins and Rangwala (1989)].

25

These *hIL-3* variants were expressed as a fusion with the *lamB* signal peptide operatively joined to the *araBAD* promoter (Greenfield, 1978) and the *g10-L* ribosome binding site (Olins et al. 1988). The signal peptide is 30 removed as part of the secretion process. The processed form was selectively released from the periplasm by osmotic shock as a correctly folded and fully active molecule. Secretion of (15-125) *hIL-3* was further optimized by using low inducer (arabinose) concentration 35 and by growth at 30°C. These conditions resulted in lower accumulation levels of unprocessed *lamB* signal peptide (15-125) *hIL-3* fusion, maximal accumulation levels of processed (15-125) *hIL-3* and selective release

60

of (15-125) hIL-3 by osmotic shock fractionation. The use of a tightly regulated promoter such as araBAD from which the transcription level and hence the expression level can be modulated allowed for the optimization of 5 secretion of (15-125) hIL-3.

The ribosome binding site (RBS) used is that from gene 10 of phage T7 (Olins et al., 1988). This is encoded in a 100 base pair (bp) fragment placed adjacent 10 to precA. In the plasmids used herein, the recognition sequence for the enzyme NcoI (5'CCATGG3') follows the g10-L RBS. It is at this NcoI site that the hIL-3 genes are joined to the plasmid. It is expected that the nucleotide sequence at this junction will be recognized 15 in mRNA as a functional start site for translation (Olins et al., 1988). The hIL-3 genes used were engineered to have a HindIII recognition site (5'AAGCTT3') following the coding sequence of the gene. Downstream of the gene is a 550 base pair fragment containing the origin of 20 replication of the single stranded phage f1 (Dente et al., 1983; Olins, et al., 1990) both incorporated herein by reference. A plasmid containing these elements is pMON2341. Another plasmid containing these elements is pMON5847 which has been deposited at the American Type 25 Culture Collection, 12301 Parklawn Drive, Rockville, Maryland 20852 under the accession number ATCC 68912.

Synthesis of Oligonucleotides

30 Oligonucleotides were synthesized by the cyanoethyl method (Adams et al. 1983, McBride, et al. 1983, Sinba et al., 1984) on Nucleotide Synthesizer model 380A or 380B from Applied Biosystems, Inc. (Foster City, California). Some oligonucleotides were purchased from Genosys 35 Biotechnologies Inc. (The Woodlands, Texas) or Midland Certified Reagent Co. (Midland, Texas). The degenerate oligonucleotides were synthesized by machine mixing an equal molar ratio of the desired nucleosides in the

condensation reaction at degenerate positions. Oligonucleotides were purified by polyacrylamide gel electrophoresis at concentrations from 12 - 20% (19:1 crosslinked) in 0.5X Tris borate (TBE) buffer (0.045 M 5 Tris, 0.045 M boric acid, 1.25 mM EDTA) as described by Atkinson (1984). The oligonucleotides were desalted by passage through a Nensorb 20 column obtained from DuPont/New England Nuclear (Boston, Massachusetts) using a PREP Automated Sample Processor obtained from DuPont, 10 Co. (Wilmington, Delaware).

Quantitation of synthetic oligonucleotides

Synthetic oligonucleotides were resuspended in water 15 (100 µl) and quantitated by reading the absorbance at 260nm on a Beckman DU40 Spectrophotometer (Irvine, California) using a one centimeter by one millimeter quartz cuvette (Maniatis, 1982). The concentration was determined using an extinction coefficient of 1 X 10⁴ 20 (Voet et al., 1963; Mahler and Cordes, 1966). The oligonucleotide was then diluted to the desired concentration.

Quantitation of synthetic DNA fragments can also be 25 achieved by adding 10 to 100 picomoles of DNA to a solution containing kinase buffer (25 mM Tris pH 8.0, 10 mM MgCl₂, 10 mM DTT and 2 mM spermidine). To the reaction mix is added ATP to 20 micromolar, ATP radiolabeled at the gamma phosphate (5000-10,0000 30 dpm/pmol) and 5 units of T4 polynucleotide kinase. Radiolabelled material is obtained from New England Nuclear (Boston, Massachusetts). The 10 microliter mixture is incubated at 37°C for one hour. A 35 1 microliter aliquot of the mixture is chromatographed on DEAE paper (DE81 from Whatman) in 0.35 M ammonium bicarbonate. The counts that remain at the origin are used to determine the concentration of the synthetic DNA.

Recombinant DNA methods

Isolation of plasmid DNA from *E. coli* cultures was performed as described (Birnboim and Doly, 1979). Some 5 DNAs were purified by Magic™ miniprep columns, available from Promega (Madison, Wisconsin).

Purified plasmid DNA was treated with restriction endonucleases according to manufacturer's instructions. 10 Analysis of the DNA fragments produced by treatment with restriction enzymes was done by agarose or polyacrylamide gel electrophoresis. Agarose (DNA grade from Fisher, Pittsburgh PA.) was used at a concentration of 1.0% in a Tris-acetate running buffer (0.04 M Tris-acetate, 0.001M 15 EDTA). Polyacrylamide (BioRad, Richmond CA.) was used at a concentration of 6% (19:1 crosslinked) in 0.5 X Tris-borate buffer (0.045 M Tris, 0.045 M boric acid, 1.25 mM EDTA), hereafter referred to as PAGE.

20 DNA polymerase I, large fragment, Klenow enzyme was used according to manufacturer's instructions to catalyze the addition of mononucleotides from 5' to 3' of DNA fragments which had been treated with restriction enzymes that leave protruding ends. The reactions were incubated 25 at 65°C for 10 minutes to heat inactivate the Klenow enzyme.

The synthetic oligonucleotides were made without 5' or 3' terminal phosphates. In cases where such 30 oligonucleotides were ligated end to end, the oligonucleotides were treated at a concentration of 10 picomoles per microliter with T4 polynucleotide kinase in the following buffer: 25 mM Tris, pH 8.0, 10 mM MgCl₂, 10 mM dithiothreitol, 2 mM spermidine, 1 mM rATP. 35 After incubation for 30 minutes at 37°C, the samples were incubated at 65°C for five minutes to heat inactivate the kinase.

Synthetic gene assembly

The (15-125) hIL-3 gene was divided into four regions separated by five convenient restriction sites.

5 In each of the four regions synthetic oligonucleotides were designed so that they would anneal in complementary pairs, with protruding single stranded ends "or blunt ends" and when the pairs were properly assembled would result in a DNA sequence that encoded a portion of the

10 hIL-3 gene. Amino acid substitutions in the hIL-3 gene were made by designing the oligonucleotides to encode the desired substitutions. The complementary oligonucleotides were annealed at concentration of 1 picomole per microliter in ligation buffer plus 50mM

15 NaCl. The samples were heated in a 100 ml beaker of boiling water and permitted to cool slowly to room temperature. One picomole of each of the annealed pairs of oligonucleotides were ligated with approximately 0.2 picomoles of plasmid DNA, digested with the appropriate

20 restriction enzymes, in ligation buffer (25 mM Tris pH 8.0, 10 mM MgCl₂, 10 mM dithiothreitol, 1 mM ATP, 2mM spermidine) with T4 DNA ligase obtained from New England Biolabs (Beverly, Massachusetts) in a total volume of 20 µl at room temperature overnight.

25

DNA fragments were isolated from agarose gels by intercepting the restriction fragments on DEAE membranes from Schleicher and Schuell (Keene, New Hampshire) and eluting the DNA in 10 mM Tris, 1 mM EDTA, 1 M NaCl at

30 55°C for 1 hour, according to manufacturer's directions. The solutions containing the DNA fragment were concentrated and desalted by using Centricon 30 concentrators from Amicon (W.R. Grace, Beverly MA) according to the manufacturer's directions. Ligations

35 were performed at 15°C overnight, except as noted, in ligation buffer (66 mM Tris pH 7.5, 6.6 mM MgCl₂, 1 mM dithiothreitol, 0.4 mM ATP) with T4 ligase obtained from New England Biolabs (Beverly, Massachusetts).

Polymerase Chain Reaction

Polymerase Chain Reaction (hereafter referred to as PCR) techniques (Saiki, 1985) used the reagent kit and thermal cycler from Perkin-Elmer Cetus (Norwalk, CT.). PCR is based on a thermostable DNA polymerase from *Thermus aquaticus*. The PCR technique is a DNA amplification method that mimics the natural DNA replication process in that the number of DNA molecules doubles after each cycle, in a way similar to in vivo replication. The DNA polymerase mediated extension is in a 5'→3' direction. The term "primer" as used herein refers to an oligonucleotide sequence that provides an end to which the DNA polymerase can add nucleotides that are complementary to a nucleotide sequence. The latter nucleotide sequence is referred to as the "template", to which the primers are annealed. The amplified PCR product is defined as the region comprised between the 5' ends of the extension primers. Since the primers have defined sequences, the product will have discrete ends, corresponding to the primer sequences. The primer extension reaction was carried out using 20 picomoles (pmoles) of each of the oligonucleotides and 1 picogram of template plasmid DNA for 35 cycles (1 cycle is defined as 94°C for one minute, 50°C for two minutes and 72°C for three minutes). The reaction mixture was extracted with an equal volume of phenol/chloroform (50% phenol and 50% chloroform, volume to volume) to remove proteins. The aqueous phase, containing the amplified DNA, and solvent phase were separated by centrifugation for 5 minutes in a microcentrifuge (Model 5414 Eppendorf Inc, Fremont CA). To precipitate the amplified DNA the aqueous phase was removed and transferred to a fresh tube to which was added 1/10 volume of 3M NaOAc (pH 5.2) and 2.5 volumes of ethanol (100% stored at minus 20°C). The solution was mixed and placed on dry ice for 20 minutes. The DNA was pelleted by centrifugation for 10 minutes in a

microcentrifuge and the solution was removed from the pellet. The DNA pellet was washed with 70% ethanol, ethanol removed and dried in a speedvac concentrator (Savant, Farmingdale, New York). The pellet was 5 resuspended in 25 microliters of TE (20mM Tris-HCl pH 7.9, 1mM EDTA). Alternatively the DNA was precipitated by adding equal volume of 4M NH₄OAc and one volume of isopropanol [Treco, (1989)]. The solution was mixed and incubated at room temperature for 10 minutes 10 and centrifuged. These conditions selectively precipitate DNA fragments larger than ~ 20 bases and were used to remove oligonucleotide primers. One quarter of the reaction was digested with restriction enzymes [Higuchi, (1989)] and on completion heated to 70°C to 15 inactivate the enzymes.

Two step site-directed PCR mutagenesis

Single amino acid substitution variants were created 20 at positions 17-123 of hIL-3 in two site-directed mutagenesis steps by PCR (Bauer et al. manuscript in preparation).

The single amino acid substitution variants at 25 positions 94-105 of hIL-3 were created as described below. In the first mutagenesis step plasmid DNA, containing the hIL-3 gene (amino acids 15-125), was the template in the PCR reaction. The DNA sequence of one of the oligonucleotide primers was designed to replace 12 30 base in the hIL-3 gene (15-125) with 12 bases encoding two translation stop codons (5' TAATAA3'), followed by the recognition sequence (5' GTCGAC3') restriction enzyme SalI. This 12 base sequence was substituted in the hIL-3 gene following the codon for amino acids 93, 97 and 101. 35 Plasmids containing these mutagenized genes served as the templates for the second mutagenesis step.

In the second mutagenesis step, the 12 base

substitution introduced in the first mutagenesis step, was replaced using a 32 fold degenerate oligonucleotide. The degenerate oligonucleotides were synthesized by machine mixing an equal molar ratio of the desired 5 nucleosides in the condensation reaction at degenerate positions. The degenerate oligonucleotides have G, A, T or C in the first and second positions and G or C in the third position of a single codon. The other bases in the oligonucleotides corresponded to the hIL-3 sequence. The 10 degenerate oligonucleotides theoretically contain 32 different codons, encoding all 20 amino acids and one translation stop codon, at a single position. At the other 9 bases the DNA sequence was restored to encode the native hIL-3 protein sequence. This pool of single amino 15 acid substitutions at a single position is referred to as a "library". This two step PCR site-directed mutagenesis approach was used to facilitate the identification of single amino acid substitution variants by differential DNA hybridization.

20

The single amino acid substitution variants at positions 17-93 and 106-123 of hIL-3 (15-125) were created as described below. In the first mutagenesis step plasmid DNA, containing the hIL-3 gene (15-125), was the 25 template in the PCR reaction. The DNA sequence of one of the oligonucleotide primers was designed to delete 18 bases in the hIL-3 gene that encode the following amino acids; 17-22, 23-28, 29-34, 35-40, 41-46, 47-52, 53-58, 59-64, 65-70, 71-76, 77-82, 83-88, 88-93, 106-111, 30 112-117 and 118-123. Plasmids containing these deletion genes served as the templates for the second mutagenesis step.

In the second mutagenesis step the 18 base deletion, 35 created in the first mutagenesis step, was restored using a 32 fold degenerate oligonucleotide. The degenerate oligonucleotides have G, A, T or C in the first and second positions and G or C in the third position of a

single codon. The other bases in the oligonucleotides corresponded to the hIL-3 sequence. The degenerate oligonucleotides theoretically contain 32 different codons, encoding all 20 amino acids and one translation stop codon, at a single position. At the other 9 bases the DNA sequence was restored to encode the native hIL-3 protein sequence. This pool of single amino acid substitutions at a single position is referred to as a "library". This two step PCR site-directed mutagenesis approach was used to facilitate the identification of single amino acid substitution variants by differential DNA hybridization.

Recovery of recombinant plasmids from ligation mixes and transformation of E. coli cells with recombinant plasmid DNA

E. coli JM101 cells were made competent to take up DNA. Typically, 20 to 100 ml of cells were grown in LB medium to a density of approximately 150 Klett units and then collected by centrifugation. The cells were resuspended in one half culture volume of 50 mM CaCl₂ and held at 4°C for one hour. The cells were again collected by centrifugation and resuspended in one tenth culture volume of 50 mM CaCl₂. DNA was added to a 150 microliter volume of these cells, and the samples were held at 4°C for 30 minutes. The samples were shifted to 42°C for one minute, one milliliter of LB was added, and the samples were shaken at 37°C for one hour. Cells from these samples were spread on plates containing ampicillin to select for transformants. The plates were incubated overnight at 37°C. Single colonies were picked and grown in LB supplemented with ampicillin overnight at 37°C with shaking. From these cultures DNA was isolated for restriction analysis.

Typically plasmids were constructed, using methods described herein or by references cited herein, as

follows except as noted in examples included herein. DNA fragments were purified from agarose or polyacrylamide gels. Purified DNA fragments were ligated and the ligation reaction mixture was used to transform E. coli 5 K-12 strain JM101. Transformant bacteria were selected on ampicillin containing plates. Plasmid DNA was isolated from a single colony grown in LB Broth and screened by restriction analysis for the desired construct and sequenced to determine that the DNA sequence was correct.

10

Culture media

LB medium (Maniatis et al., 1982) was used for growth of cells for DNA isolation. M9 minimal medium 15 supplemented with 1.0% casamino acids, acid hydrolyzed casein, Difco (Detroit, Michigan) was used for cultures in which recombinant hIL-3 was produced. The ingredients in the M9 medium were as follows: 3g/liter KH₂PO₄, 6g/l Na₂HPO₄, 0.5 g/l NaCl, 1 g/l NH₄Cl, 1.2 mM MgSO₄, 0.025 20 mM CaCl₂, 0.2% glucose (0.2% glycerol with the AraBAD promoter), 1% casamino acids, 0.1 ml/l trace minerals (per liter 108 g FeCl₃·6H₂O, 4.0 g ZnSO₄·7H₂O, 7.0 CoCl₂·2H₂O, 7.0 g Na₂MoO₄·2H₂O, 8.0 g CuSO₄·5H₂O, 2.0 g H₃BO₃, 5.0 g MnSO₄·H₂O, 100 ml concentrated HCl). Bacto 25 agar from Difco was used for solid media and ampicillin (Polycillin-N from Bristol-Meyers, Evansville, Indiana) was added to both liquid and solid LB media at 200 micrograms per milliliter.

30 DNA sequence analysis

The nucleotide sequencing of plasmid DNA was performed using a Genesis 2000 sequencer obtained from DuPont (Wilmington, Delaware) according to the methods of 35 Prober et al. (1987) and Sanger et al. (1977). Some DNA sequences were determined using Sequenase™ polymerase according to the protocol of its supplier, U.S. Biochemicals (Cleveland, Ohio).

69

Production of recombinant hIL-3 muteins in E. coli with vectors employing the recA promoter

5 E. coli strains harboring the plasmids of interest were grown at 37°C in M9 plus casamino acids medium with shaking in a Gyrotory water bath Model G76 from New Brunswick Scientific (Edison, New Jersey). Growth was monitored with a Klett Summerson meter (green 54 filter),
10 Klett Mfg. Co. (New York, New York). At a Klett value of approximately 150, an aliquot of the culture (usually one milliliter) was removed for protein analysis. To the remaining culture, nalidixic acid (10mg/ml) in 0.1 N NaOH was added to a final concentration of 50 µg/ml. The
15 cultures were shaken at 37°C for three to four hours after addition of nalidixic acid. A high degree of aeration was maintained throughout the bacterial growth in order to achieve maximal production of the desired gene product. The cells were examined under a light
20 microscope for the presence of refractile bodies (RBs). One milliliter aliquots of the culture were removed for analysis of protein content.

Production of recombinant hIL-3 proteins from the AraBAD promoter in E. coli

25 E. coli strains harboring the plasmids of interest were grown at 30°C with shaking in M9 medium plus casamino acids and glycerol. Growth was monitored with a Klett Summerson colorimeter, using a green 54 filter. At a Klett value of about 150, an aliquot of the culture (usually one milliliter) was removed for protein analysis. To the remaining culture, 20% arabinose was added to a final concentration of 0.05%. The cultures
30 were shaken at 30°C for three to four hours after addition of arabinose. A high degree of aeration was maintained throughout the bacterial growth in order to achieve maximal production of the desired gene product.

One milliliter aliquots of the culture were removed for analysis of protein content.

Secretion and osmotic shock

5

Three hour post induction samples were fractionated by osmotic shock [Neu and Heppel (1965)]. The Klett value of the cultures was determined and 1 ml of cells were centrifuged in a Sigma microcentrifuge (West 10 Germany) model 202MK in 1.5 mls snap top microcentrifuge tubes for 5 minutes at 10,000 rpm. The cell pellet was resuspended very gently by pipeting in a room temperature sucrose solution (20% sucrose w/v, 30mM Tris-Hcl pH7.5, 1mM EDTA), using 1 μ l/1 Klett unit. Following a 10 minute 15 incubation at room temperature, the cells were centrifuged for 5 minutes at 10,000 rpm. The sucrose fraction was carefully removed from the cell pellet. The cell pellet was then resuspended very gently by pipeting in ice cold distilled water, using 1 μ l/1 Klett unit. 20 Following a 10 minute incubation on ice, the cells were centrifuged for 5 minutes at 12,000 rpm. The water fraction was carefully removed. Equal volumes of the sucrose and water fractions were pooled and aliquoted to provide samples for ELISA and biological activity 25 screening.

Analysis of protein content of E. coli cultures producing hIL-3 mutant polypeptides

30 Bacterial cells from cultures treated as described above were collected from the medium by centrifugation. Aliquots of these cells were resuspended in SDS loading buffer (4X: 6 g SDS, 10 ml beta-mercaptoethanol, 25 ml upper Tris gel stock (0.5 M Tris HCl pH 6.8, 0.4% SDS) 35 brought to 50 ml with glycerol, 0.2% bromophenol blue was added) at a concentration of one microliter per Klett unit. These samples were incubated at 85°C for five minutes and vortexed. Five or ten microliter aliquots of

these samples were loaded on 15% polyacrylamide gels prepared according to the method of Laemmli (1970). Protein bands were visualized by staining the gels with a solution of acetic acid, methanol and water at 5:1:5
5 (volume to volume) ratio to which Coomassie blue had been added to a final concentration of 1%. After staining, the gels were washed in the same solution without the Coomassie blue and then washed with a solution of 7% acetic acid, 5% methanol. Gels were dried on a gel drier
10 Model SE1160 obtained from Hoeffer (San Francisco, California). The amount of stained protein was measured using a densitometer obtained from Joyce-Loebl (Gateshead, England). The values obtained were a measure of the amount of the stained hIL-3 protein compared to
15 the total of the stained protein of the bacterial cells.

Western blot analysis of hIL-3 muteins made in E. coli

In some E. coli cultures producing hIL-3, the level
20 of accumulation of the hIL-3 protein is lower than 5% of total bacterial protein. To detect hIL-3 produced at this level, Western blot analysis was used. Proteins from cultures induced with nalidixic acid or arabinose were run on polyacrylamide gels as described above except
25 that volumes of sample loaded were adjusted to produce appropriate signals. After electrophoresis, the proteins were electroblotted to APT paper, Transa-bind, Schleicher and Schuell (Keene, New Hampshire) according to the method of Renart et al. (1979). Antisera used to probe
30 these blots had been raised in rabbits, using peptides of the sequence of amino acids 20 to 41 and 94 to 118 of hIL-3 as the immunogens. The presence of bound antibody was detected with Staphylococcal protein A radiolabeled with ¹²⁵I, obtained from New England Nuclear (Boston,
35 Massachusetts).

Fractionation of E. coli cells producing hIL-3 proteins in the cytoplasm

Cells from *E. coli* cultures harboring plasmids that produce hIL-3 muteins were induced with nalidixic acid. After three hours, the hIL-3 muteins accumulated in refractile bodies. The first step in purification of the hIL-3 muteins was to sonicate cells. Aliquots of the culture were resuspended from cell pellets in sonication buffer: 10 mM Tris, pH 8.0, 1 mM EDTA, 50 mM NaCl and 0.1 mM PMSF. These resuspended cells were subjected to several repeated sonication bursts using the microtip from a Sonicator cell disrupter, Model W-375 obtained from Heat Systems-Ultrasonics Inc. (Farmingdale, New York). The extent of sonication was monitored by examining the homogenates under a light microscope. When nearly all of the cells had been broken, the homogenates were fractionated by centrifugation. The pellets, which contain most of the refractile bodies, are highly enriched for hIL-3 muteins.

20 Methods: Extraction, Refolding and Purification of Interleukin-3 (IL-3) Muteins Expressed as Refractile Bodies in E. coli.

Extraction of refractile bodies (RB's):

25 For each gram of RB's (and typically one gram is obtained from a 300 ml *E. coli* culture), 5 ml of a solution containing 6M guanidine hydrochloride (GnHCl), 50 mM 2-N-cyclohexylaminoethanesulfonic acid (CHES) pH 9.5 and 20 mM dithiothreitol (DTT) was added. The 30 RB's were extracted with a Bio-Homogenizer for 15-30 seconds and gently rocked for 2 hours at 5 degrees centigrade (5°C) to allow the protein to completely reduce and denature.

35 Refolding of the IL-3 muteins

The protein solution was transferred to dialysis tubing (1000 molecular weight cut-off) and dialyzed

against at least 100 volumes of 4M GnHCl - 50 mM CHES pH 8.0. The dialysis was continued overnight at 5°C while gently stirring. Subsequently dialysis was continued against at least 100 volumes of 2M GnHCl - 5 50 mM CHES pH 8.0 and dialyzed overnight at 5°C while gently stirring.

Purification of the IL-3 muteins

10 The protein solution was removed from the dialysis tubing and acidified by the addition of 40% acetonitrile (CH₃CN) - 0.2% trifluoroacetic acid (TFA) to a final concentration of 20% CH₃CN - 0.1% TFA. This was centrifuged (16,000 x g for 5 minutes) to clarify and the 15 supernatant was loaded onto a Vydac C-18 reversed phase column (10x250 mm) available from Vydac (Hesperia, California) previously equilibrated in 20% CH₃CN - 0.1% TFA. The column was eluted with a linear gradient (0.2% CH₃CN/minute) between 40 - 50% CH₃CN - 0.1% TFA at a flow 20 rate of 3 ml/minute while collecting 1.5 ml fractions. The fractions were analyzed by polyacrylamide gel electrophoresis (SDS-PAGE) and the appropriate fractions pooled. The pooled material was dried by lyophilization or in a Speed Vac concentrator. The dry powder was 25 reconstituted with 10 mM ammonium bicarbonate pH 7.5, centrifuged (16,000 x g for 5 minutes) to clarify and assayed for protein concentration by the method of Bradford (1976) with bovine serum albumin as the standard. Such protein can be further analyzed by 30 additional techniques such as, SDS-PAGE, electrospray mass spectrometry, reverse phase HPLC, capillary zone electrophoresis, amino acid composition analysis, and ELISA (enzyme-linked immunosorbent assay).

35 hIL-3 SANDWICH ELISA

IL-3 protein concentrations were determined using a sandwich ELISA based on an affinity purified polyclonal

goat anti-rhIL-3. Microtiter plates (Dynatech Immulon II) were coated with 150 µl goat-anti-rhIL-3 at a concentration of approximately 1 µg/ml in 100 mM NaHCO₃, pH 8.2. Plates were incubated overnight at room temperature in a chamber maintaining 100% humidity.

5 Wells were emptied and the remaining reactive sites on the plate were blocked with 200 µl of solution containing 10 mM PBS, 3% BSA and 0.05% Tween 20, pH 7.4 for 1 hour at 37° C and 100% humidity. Wells were emptied and

10 washed 4X with 150 mM NaCl containing 0.05% Tween 20 (wash buffer). Each well then received 150 µl of dilution buffer (10 mM PBS containing 0.1% BSA, 0.01% Tween 20, pH 7.4), containing rhIL-3 standard, control, sample or dilution buffer alone. A standard curve was

15 prepared with concentrations ranging from 0.125 ng/ml to 5 ng/ml using a stock solution of rhIL-3 (concentration determined by amino acid composition analysis). Plates were incubated 2.5 hours at 37° C and 100% humidity.

Wells were emptied and each plate was washed 4X with wash

20 buffer. Each well then received 150 µl of an optimal dilution (as determined in a checkerboard assay format) of goat anti-rhIL-3 conjugated to horseradish peroxidase. Plates were incubated 1.5 hours at 37° C and 100% humidity. Wells were emptied and each plate was washed

25 4X with wash buffer. Each well then received 150 ul of ABTS substrate solution (Kirkegaard and Perry). Plates were incubated at room temperature until the color of the standard wells containing 5 ng/ml rhIL-3 had developed enough to yield an absorbance between 0.5-1.0 when read

30 at a test wavelength of 410 nm and a reference wavelength of 570 nm on a Dynatech microtiter plate reader. Concentrations of immunoreactive rhIL-3 in unknown samples were calculated from the standard curve using software supplied with the plate reader.

35

AML Proliferation Assay for Bioactive Human Interleukin-3

The factor-dependent cell line AML 193 was obtained

from the American Type Culture Collection (ATCC, Rockville, MD). This cell line, established from a patient with acute myelogenous leukemia, is a growth factor dependent cell line which displayed enhanced 5 growth in GM/CSF supplemented medium (Lange, B., et al., (1987); Valtieri, M., et al., (1987)). The ability of AML 193 cells to proliferate in the presence of human IL-3 has also been documented. (Santoli, D., et al., (1987)). A cell line variant was used, AML 193 1.3, which was 10 adapted for long term growth in IL-3 by washing out the growth factors and starving the cytokine dependent AML 193 cells for growth factors for 24 hours. The cells were then replated at 1×10^5 cells/well in a 24 well plate in media containing 100 U/ml IL-3. It took approximately 15 2 months for the cells to grow rapidly in IL-3. These cells were maintained as AML 193 1.3 thereafter by supplementing tissue culture medium (see below) with human IL-3.

20 AML 193 1.3 cells were washed 6 times in cold Hanks balanced salt solution (HBSS, Gibco, Grand Island, NY) by centrifuging cell suspensions at $250 \times g$ for 10 minutes followed by decantation of supernatant. Pelleted cells were resuspended in HBSS and the procedure was repeated 25 until six wash cycles were completed. Cells washed six times by this procedure were resuspended in tissue culture medium at a density ranging from 2×10^5 to 5×10^5 viable cells/ml. This medium was prepared by supplementing Iscove's modified Dulbecco's Medium (IMDM, 30 Hazleton, Lenexa, KS) with albumin, transferrin, lipids and 2-mercaptoethanol. Bovine albumin (Boehringer-Mannheim, Indianapolis, IN) was added at 500 $\mu\text{g}/\text{ml}$; human transferrin (Boehringer-Mannheim, Indianapolis, IN) was added at 100 $\mu\text{g}/\text{ml}$; soybean lipid (Boehringer-Mannheim, 35 Indianapolis, IN) was added at 50 $\mu\text{g}/\text{ml}$; and 2-mercaptoethanol (Sigma, St. Louis, MO) was added at $5 \times 10^{-5}\text{M}$.

Serial dilutions of human interleukin-3 or human interleukin-3 variant protein (hIL-3 mutein) were made in triplicate series in tissue culture medium supplemented as stated above in 96 well Costar 3596 tissue culture plates. Each well contained 50 µl of medium containing interleukin-3 or interleukin-3 variant protein once serial dilutions were completed. Control wells contained tissue culture medium alone (negative control). AML 193 1.3 cell suspensions prepared as above were added to each well by pipetting 50 µl (2.5×10^4 cells) into each well. Tissue culture plates were incubated at 37°C with 5% CO₂ in humidified air for 3 days. On day 3, 0.5 µCi ³H-thymidine (2 Ci/mM, New England Nuclear, Boston, MA) was added in 50 µl of tissue culture medium. Cultures were incubated at 37°C with 5% CO₂ in humidified air for 18-24 hours. Cellular DNA was harvested onto glass filter mats (Pharmacia LKB, Gaithersburg, MD) using a TOMTEC cell harvester (TOMTEC, Orange, CT) which utilized a water wash cycle followed by a 70% ethanol wash cycle. Filter mats were allowed to air dry and then placed into sample bags to which scintillation fluid (Scintiverse II, Fisher Scientific, St. Louis, MO or BetaPlate Scintillation Fluid, Pharmacia LKB, Gaithersburg, MD) was added. Beta emissions of samples from individual tissue culture wells were counted in a LKB Betaplate model 1205 scintillation counter (Pharmacia LKB, Gaithersburg, MD) and data was expressed as counts per minute of ³H-thymidine incorporated into cells from each tissue culture well. Activity of each human interleukin-3 preparation or human interleukin-3 variant preparation was quantitated by measuring cell proliferation (³H-thymidine incorporation) induced by graded concentrations of interleukin-3 or interleukin-3 variant. Typically, concentration ranges from 0.05 pM - 10⁵ pM are quantitated in these assays. Activity is determined by measuring the dose of interleukin-3 or interleukin-3 variant which provides 50% of maximal proliferation [EC₅₀ = 0.5 x (maximum average counts per minute of ³H-thymidine incorporated per well

among triplicate cultures of all concentrations of interleukin-3 tested - background proliferation measured by ^3H -thymidine incorporation observed in triplicate cultures lacking interleukin-3]. This EC₅₀ value is also 5 equivalent to 1 unit of bioactivity. Every assay was performed with native interleukin-3 as a reference standard so that relative activity levels could be assigned.

Relative biological activities of some IL-3 muteins of the present invention are shown in Table 1. The Relative Biological Activity of IL-3 mutants is calculated by dividing the EC50 of (1-133) hIL-3 by the 5 EC50 of the mutant. The Relative Biological Activity may represent the average of replicate assays.

TABLE 1

10

BIOLOGICAL ACTIVITY OF IL-3 MUTEINS

Plasmid	Polypeptide Structure	Relative Biological Activity
Code	Reference	(1-133)hIL-3
pMON13286	[SEQ ID NO. 69]	8.0
pMON13304	[SEQ ID NO. 66]	3.2

20 * The Relative Biological Activity of IL-3 mutants is calculated by dividing the EC50 of (1-133) hIL-3 by the EC50 of the mutant.

25 The following assay is used to measure IL-3 mediated sulfidoleukotriene release from human mononuclear cells.

IL-3 mediated sulfidoleukotriene release from human mononuclear cells

30 Heparin-containing human blood was collected and layered onto an equal volume of Ficoll-Paque (Pharmacia # 17-0840-02) ready to use medium (density 1.077 g/ml.). The Ficoll was warmed to room temperature prior to use and clear 50 ml polystyrene tubes were utilized. The 35 Ficoll gradient was spun at 300 x g for 30 minutes at room temperature using a H1000B rotor in a Sorvall RT6000B refrigerated centrifuge. The band containing the mononuclear cells was carefully removed, the volume adjusted to 50 mls with Dulbecco's phosphate-buffered 40 saline (Gibco Laboratories cat. # 310-4040PK), spun at 400 x g for 10 minutes at 4°C and the supernatant was

carefully removed. The cell pellet was washed twice with HA Buffer [20 mM Hepes (Sigma # H-3375), 125 mM NaCl (Fisher # S271-500), 5 mM KCl (Sigma # P-9541), 0.5 mM glucose (Sigma # G-5000), 0.025% Human Serum Albumin 5 (Calbiochem # 126654) and spun at 300 x g, 10 min., 4°C. The cells were resuspended in HACM Buffer (HA buffer supplemented with 1 mM CaCl₂ (Fisher # C79-500) and 1 mM MgCl₂ (Fisher # M-33) at a concentration of 1 x 10⁶ cells/ml and 180 µl were transferred into each well of 96 10 well tissue culture plates. The cells were allowed to acclimate at 37°C for 15 minutes. The cells were primed by adding 10 µls of a 20 X stock of various concentrations of cytokine to each well (typically 100000, 20000, 4000, 800, 160, 32, 6.4, 1.28, 0 fM IL3). 15 The cells were incubated for 15 minutes at 37°C. Sulfidoleukotriene release was activated by the addition of 10 µls of 20 X (1000 nM) fmet-leu-phe (Calbiochem # 344252) final concentration 50nM FMLP and incubated for 10 minutes at 37°C. The plates were spun at 350 x g at 20 4°C for 20 minutes. The supernatants were removed and assayed for sulfidoleukotrienes using Cayman's Leukotriene C4 EIA kit (Cat. #420211) according to manufacturers' directions. Native (15-125)^hIL-3 was run as a standard control in each assay.

25 Native hIL-3 possesses considerable inflammatory activity and has been shown to stimulate synthesis of the arachidonic acid metabolites LTC₄, LTD₄, and LTE₄; histamine synthesis and histamine release. Human 30 clinical trials with native hIL-3 have documented inflammatory responses (Biesma, et al., BLOOD, 80:1141-1148 (1992) and Postmus, et al., J. CLIN. ONCOL., 10:1131-1140 (1992)). A recent study indicates that 35 leukotrienes are involved in IL-3 actions in vivo and may contribute significantly to the biological effects of IL-3 treatment (Denzlinger, C., et al., BLOOD, 81:2466-2470 (1993))

Some muteins of the present invention may have an improved therapeutic profile as compared to native hIL-3 or (15-125)hIL-3. For example, some muteins of the present invention may have a similar or more potent 5 growth factor activity relative to native hIL-3 or (15-125)hIL-3 without having a similar or corresponding increase in the stimulation of leukotriene or histamine. These muteins would be expected to have a more favorable therapeutic profile since the amount of polypeptide which 10 needs to be given to achieve the desired growth factor activity (e. g. cell proliferation) would have a lesser leukotriene or histamine stimulating effect. In studies with native hIL-3, the stimulation of inflammatory factors has been an undesirable side effect of the 15 treatment. Reduction or elimination of the stimulation of mediators of inflammation would provide an advantage over the use of native hIL-3.

Some muteins of the present invention may have 20 antigenic profiles which differ from that of native hIL-3. For example, in a competition ELISA with an affinity purified polyclonal goat anti-hIL-3 antibody, native hIL-3 significantly blocked the binding of labeled hIL-3 to polyclonal anti-hIL-3 antibody. Some 25 polypeptides of the present invention, particularly those with several amino acids differing from those of native hIL-3, fail to block the binding of hIL-3 to anti-hIL-3 antibody.

30 Table 2 lists the sequences of some oligonucleotides used in making the muteins of the present invention.

Table 3 lists the amino acid sequence of native (15-125)hIL-3 (Peptide #1) and the amino acid sequences of 35 some mutant polypeptides of the present invention. The sequences are shown with the amino acid numbering corresponding to that of native hIL-3 [FIG. 1].

Polypeptides corresponding to SEQ ID NOS. 15, 16,
5 17, 18 and 129 comprising (1-133)hIL-3 containing one or
more amino acid substitutions can be made using the
procedures described above and in the following examples
by starting with the appropriate oligonucleotides and
10 then constructing the DNA encoding the polypeptide and
expressing it in an appropriate host cell. In a similar
manner polypeptides which correspond to SEQ ID NOS. 19,
20, 21, 22 and 130 and contain one or more amino acid
substitutions and wherein from 1 to 14 amino acids have
been sequentially deleted from the N-terminus, or from 1
15 to 15 amino acids have been deleted from the C-terminus
or deletions of amino acids have been made from both the
N-terminus and the C-terminus can also be made by
following the procedures described above and in the
following examples, beginning with the appropriate
20 starting materials.

Additional details may be found in United States
Patent Application Serial No. 07/981,044 filed
November 24, 1992, which is hereby incorporated by
25 reference in its entirety.

Additional details may be found in co filed United
States Patent Application Attorney docket number 2713/2,
which is hereby incorporated by reference in its
entirety.

30 All references, patents or applications cited herein
are incorporated by reference in their entirety.

Further details known to those skilled in the art
may be found in T. Maniatis, et al., Molecular Cloning, A
35 Laboratory Manual, Cold Spring Harbor Laboratory (1982)
and references cited therein, incorporated herein by
reference in its entirety; and in J. Sambrook, et al.,
Molecular Cloning, A Laboratory Manual, 2nd edition, Cold

Spring Harbor Laboratory (1989) and references cited therein, incorporated herein by reference in its entirety.

5 The following examples will illustrate the invention in greater detail although it will be understood that the invention is not limited to these specific examples.

10 Amino acids are shown herein by standard one letter or three letter abbreviations as follows:

	<u>Abbreviated Designation</u>	<u>Amino Acid</u>
	A	Alanine
15	C	Cysteine
	D	Aspartic acid
	E	Glutamic acid
	F	Phenylalanine
	G	Glycine
20	H	Histidine
	I	Isoleucine
	K	Lysine
	L	Leucine
	M	Methionine
25	N	Asparagine
	P	Proline
	Q	Glutamine
	R	Arginine
	S	Serine
30	T	Threonine
	V	Valine
	W	Tryptophan
	Y	Tyrosine

Various other examples will be apparent to the person skilled in the art after reading the present disclosure without departing from the spirit and scope of the invention. It is intended that all such other

examples be included within the scope of the appended claims.

EXAMPLE 1

Construction of pMON 5846 (Fig. 4) which encodes [Met-(1-133)hIL-3 (Arg¹²⁹)]

10

A plasmid containing the gene for the cDNA of hIL-3 cloned into pUC18 on an EcoRI to HindIII fragment was obtained from British Biotechnology Limited (Cambridge, England). This plasmid was designated pPO518. The 15 purified plasmid DNA was cleaved by the restriction endonucleases NheI and BamHI. Approximately 0.5 micrograms of cleaved plasmid DNA was ligated to 1.0 picomoles of a pair of annealed oligonucleotides with the following sequence:

20

5'-CTAGCGATTTTAATAAGCTTG-3' [SEQ ID NO: 1]
3'-GCTAGAAAATTATTCGAACCTAG-5' [SEQ ID NO: 2]

The ligation mixture was used to transform competent 25 JM101 cells to ampicillin resistance. Colonies were picked, and plasmid DNA was purified and subjected to restriction enzyme analysis. An isolate was identified in which the above oligonucleotide sequence had replaced the portion of the gene that encodes the extreme 30 C-terminus. Within the new sequence was a new stop codon, TAA, and a recognition site for the enzyme HindIII. The new plasmid was designated pMON5846.

EXAMPLE 2

35

(a) Construction of expression vector plasmid pMON2341

The plasmid pMON2341 was used to supply the

particular replicon and expression elements used for construction of many of the plasmids used to produce hIL-3 and hIL-3 muteins in *E. coli*. These expression elements are described in the materials and methods section. pMON2341 is derived from pMON5515 (Olins et al., 1988) and from pMON2429. pMON2429 consists of the phage mp18 (Yanisch-Perron et al., 1985) with a BclI fragment carrying the chloramphenicol acetyl transferase (cat) gene from pBR328 (Covarrubias et al., 1981)

5 10 15 20 25 30 35 40

inserted into the BamHI site. The cat gene in pMON2429 has been altered from that in pBR328 by site directed mutagenesis (Kunkel, 1985). The recognition sites for NcoI and EcoRI which occur in the native gene were altered so that these two restriction enzymes no longer recognize these sites. The changes did not alter the protein specified by the gene. Also, an NcoI site was introduced at the N-terminus of the coding sequence so that it overlaps the codon for initiator methionine.

20 The steps involved in construction of pMON2341 are listed below:

(1) The DNAs of pMON5515 and pMON2429 were treated with NcoI and HindIII. The fragments were ligated and 25 used to transform competent *E. coli* to ampicillin resistance. From these colonies, some were identified that were chloramphenicol resistant. From one of these colonies, plasmid DNA was isolated in which the rat atriopeptidase gene of pMON5515 had been replaced by the 30 NcoI to HindIII fragment containing the cat gene from pMON2429. This fragment contains the recognition sites for several restriction enzymes in the portion derived from the multilinker region of mp18. The new plasmid was designated pMON2412.

35

(2) pMON2412 was treated with the enzyme Clal which cleaves at one location in the pBR327 derived portion of the DNA. The protruding ends were rendered blunt by

treatment with Klenow in the presence of nucleotide precursors. This DNA was mixed with an isolated 514 bp RsaI fragment derived from pEMBL8 (Dente et al., 1983). This RsaI fragment contains the origin of replication of phage f1. This ligation mixture was used to transform competent *E. coli* cells to ampicillin resistance. Among the plasmid DNAs isolated from these cells was pMON5578. This plasmid has the structure of pMON2412 with the f1 origin region inserted into the Clal site. This is illustrated in the Figures and in Ollins and Rangwala (1990).

(3) The DNA of pMON5578 was treated with restriction enzymes HindIII and MstII. The DNA was then treated with Klenow enzyme in the presence of nucleotide precursors to render the ends blunt. This treated DNA was ligated and used to transform competent *E. coli* to ampicillin resistance. From the ampicillin resistant colonies, one plasmid was recovered from which the portion between HindIII and MstII was absent. This deletion resulted in the removal of sequences from the plasmid which are recognized by a number of restriction endonuclease sites. The new plasmid was designated pMON5582.

(4) The DNA of pMON5582 was treated with SstII and BclI and ligated in the presence of annealed oligonucleotides with the sequences shown below.

5' - GGCAACAATTCTACAAAACACTTGATACTGTATGAGCAT-
3' - CGCCGTTGTTAAAGATGTTTGTGAACATATGACATACTCGTA-

ACAGTATAATTGCTTCAACAGAACAGATC-3' [SEQ ID NO:3]
TGTCATATTAACGAAGTTGTCTTGT-5' [SEQ ID NO:4]

This sequence encodes the essential elements of the recA promoter of *E. coli* including the transcription start site and the lexA repressor binding site (the operator) (Sancar et al., 1980). The plasmid recovered

from the ligation mixes contained this recA promoter in place of the one in pMON5582 (and in pMON5515). The functionality of the recA promoter was illustrated by Olins and Rangwala (1990). The new plasmid was 5 designated pMON5594.

(5) To eliminate the single EcoRI site in pMON5594, the DNA was treated with EcoRI, then with Klenow in the presence of nucleotide precursors to render the ends 10 blunt and then the DNA was ligated. From this ligation mix a plasmid was recovered whose DNA was not cleaved with EcoRI. This plasmid was designated pMON5630.

(6) To alter the single recognition site for PstI, 15 plasmid pMON5630 was subjected to site directed mutagenesis (Kunkel, 1985). The oligonucleotide used in this procedure has the sequence shown below.

5'-CCATTGCTGCCGGCATCGTGGTC-3' [SEQ ID NO:5]
20
The result of the procedure was to construct pMON2341 which differs from pMON5630 in that the PstI site in the beta-lactamase gene was altered so that PstI no longer recognizes the site. The single nucleotide 25 change does not alter the amino acid sequence of the beta-lactamase protein.

(b) Construction of pMON5847 (Fig. 5) which encodes [Met-(1-133)hIL-3(Arg129)]
30
Plasmid pMON2341 was used to supply the replicon, promotor, ribosome binding site, transcription terminator and antibiotic resistance marker for the plasmids used to produce hIL-3 in *E. coli* from cDNA derived hIL-3 genes.

35
Plasmid pMON2341 was treated with restriction enzymes NcoI and HindIII. The restriction fragment containing the replication origin was purified. The DNA

of plasmid pMON5846 was treated with NcoI and HindIII. The restriction fragment containing the hIL-3 gene was gel purified. These purified restriction fragments were mixed and ligated. The ligation mixture was used to 5 transform competent JM101 cells to ampicillin resistance. Colonies were picked, and plasmid DNA was purified and analyzed using restriction enzymes. pMON5847 was identified as a plasmid with the replicon of pMON2341 and the hIL-3 gene in place of the chloramphenicol acetyl 10 transferase gene. JM101 cells harboring this plasmid were cultured in M9 medium and treated with nalidixic acid as described above. Samples of the culture were examined for protein content. It was found that this hIL-3 mutein was produced at about 6% of total cell 15 protein as measured on Coomassie stained polyacrylamide gels.

EXAMPLE 3

20 Construction of pMON5854 (Fig. 7) which encodes [Met-(1-
133)hIL-3(Arg129)]

To increase the accumulation of hIL-3 in *E. coli*, the coding sequence of the amino terminal portion of the 25 protein was altered to more closely reflect the codon bias found in *E. coli* genes that produce high levels of proteins (Gouy and Gautier, 1982). To change the coding sequence for the amino terminal portion of the gene, a pair of synthetic oligonucleotides were inserted between 30 the NcoI and HpaI sites within the coding sequence. About 0.5 micrograms of DNA of the plasmid pMON5847 (Example 2) was treated with NcoI and HpaI. This DNA was mixed with an annealed pair of oligonucleotides with the following sequence:

35

5'-CATGGCTCCAATGACTCAGACTACTTCTCTTAAGACT-
3'-CGAGGGTTACTGAGTCTGATGAAGAGAATTCTGA-

TCTTGGGTT-3' [SEQ ID NO:6]
AGAACCCAA-5' [SEQ ID NO:7]

The fragments were ligated. The ligation mixture
5 was used to transform competent JM101 to ampicillin
resistance. Colonies were picked into broth. From the
cultures plasmid DNA was made and examined for the
presence of a DdeI site (CTNAG) which occurs in the
synthetic sequence but not between the NcoI and HpaI
10 sites in the sequence of pMON5847. The new recombinant
plasmid was designated pMON5854. The nucleotide sequence
of the DNA in the coding sequence of the amino terminal
portion of the hIL-3 gene in pMON5854 was determined by
DNA sequencing and found to be the same as that of the
15 synthetic oligonucleotide used in ligation. Cultures of
JM101 cells harboring this plasmid were grown and treated
with nalidixic acid to induce production of the hIL-3
mutant protein. Analysis of the proteins on Coomassie
gels showed that the accumulation of hIL-3 mutein was
20 about 25% of total cell protein in cultures harboring
pMON5854, significantly higher than it was in cultures
harboring pMON5847.

EXAMPLE 4

25

Construction of pMON5887 (Fig. 12) which encodes [Met-(1-
125)hIL-3]

The plasmid DNA of pMON5854 (Example 3) was treated
30 with EcoRI and HindIII and the larger fragment was gel
purified. About 0.5 microgram of this DNA was ligated to
1 picomole of an annealed pair of oligonucleotides which
encode amino acids 107 through 125 of hIL-3. The
sequences of these oligonucleotides are shown below.

35 EcoRI to HindIII

5'-AATTCCGTGTAAACTGACCTTCTATCTGAAAAA-
3'-GGCAGCATTGACTGGAAGATAGACTTTT-

CCTTGGAGAACGCGCAGGCTAACAGTAATA-3' [SEQ ID NO:8]
GGAACCTCTTGCAGTCGAGTTGTCATTATTCGA-5' [SEQ ID NO:9]

After ligation, the DNA was used to transform
5 competent JM101 cells to ampicillin resistance. Colonies
were picked into broth and plasmid DNA was isolated from
each culture. Restriction analysis of the plasmid DNA
showed the presence of an EcoRI to HindIII fragment
smaller than that of pMON5854. The nucleotide sequence
10 of the portion of the coding sequence between the EcoRI
and HindIII sites was determined to confirm the accuracy
of the replaced sequence. The new plasmid was designated
pMON5887 encoding Met-(1-125)hIL-3 which has the
following amino acid sequence:

15

Met Ala Pro Met Thr Gln Thr Ser Leu Lys Thr Ser
Trp Val Asn Cys Ser Asn Met Ile Asp Glu Ile Ile Thr
His Leu Lys Gln Pro Pro Leu Pro Leu Asp Phe Asn
Asn Leu Asn Gly Glu Asp Gln Asp Ile Leu Met Glu Asn
20 Asn Leu Arg Arg Pro Asn Leu Glu Ala Phe Asn Arg Ala
Val Lys Ser Leu Gln Asn Ala Ser Ala Ile Glu Ser Ile
Leu Lys Asn Leu Leu Pro Cys Leu Pro Leu Ala Thr Ala
Ala Pro Thr Arg His Pro Ile His Ile Lys Asp Gly Asp
Trp Asn Glu Phe Arg Arg Lys Leu Thr Phe Tyr Leu Lys
25 Thr Leu Glu Asn Ala Gln Ala Gln [SEQ ID NO:10]

EXAMPLE 5

Construction of pMON5967 which encodes
30 [Met-Ala-(15-125)hIL-3]

Plasmid DNA of pMON5887 isolated from *E. coli* GM48
(dam-) was cleaved with NcoI and ClaI and ligated to 1
picomole of an annealed pair of oligonucleotides, Nco I
35 and ClaI, encoding amino acids [Met Ala (15-20)hIL-3].
The sequence of these oligonucleotides is shown below.

5'-CATGGCTAACTGCTCTAACATGAT-3' [SEQ ID NO:11]

3'-CGATTGACGAGATTGTACTAGC-5' [SEQ ID NO:12]

The resulting ligation mix was used to transform competent *E. coli* JM101 cells to ampicillin resistant colonies. Plasmid DNA was isolated from these cells and the size of the inserted fragment was determined to be smaller than that of pMON5887 by restriction analysis using NcoI and NsiI. The nucleotide sequence of the region between NcoI and ClaI was determined and found to be that of the synthetic oligonucleotides. The new plasmid was designated pMON5967 and cells containing it were induced for protein production. Sonicated cell pellets and supernatants were used for protein purification and bio-assay.

15

EXAMPLE 6

Construction of pMON5978 which encodes
[Met-Ala-(15-125)hIL-3]

20

Plasmid DNA of pMON5967 isolated from *E. coli* GM48(dam-) was cleaved with ClaI and NsiI and ligated to 1 picomole of an annealed assembly of six oligonucleotides encoding hIL-3 amino acids 20-70 (FIG. 2). This synthetic fragment encodes three unique restriction sites, EcoRV, XhoI and PstI. The sequence of these oligonucleotides is shown in Figure 2.

The resulting ligation mix was used to transform competent *E. coli* JM101 cells to ampicillin resistant colonies. Plasmid DNA was isolated and screened with XbaI and EcoRV for the presence of the new restriction site EcoRV. The DNA sequence of the region between ClaI and NsiI was determined and found to be the same as that of the synthetic oligonucleotides. The new plasmid was designated pMON5978, and cells containing it were induced for protein production. Sonicated cell pellets and supernatants were used for protein purification and bio-

assay.

Plasmid pMON5978 encodes [Met-Ala-(15-125)hIL-3] which has the following amino acid sequence:

5 Met Ala Asn Cys Ser Asn Met Ile Asp Glu Ile Ile Thr
His Leu Lys Gln Pro Pro Leu Pro Leu Leu Asp Phe Asn
Asn Leu Asn Gly Glu Asp Gln Asp Ile Leu Met Glu Asn
Asn Leu Arg Arg Pro Asn Leu Glu Ala Phe Asn Arg Ala
Val Lys Ser Leu Gln Asn Ala Ser Ala Ile Glu Ser Ile
10 Leu Lys Asn Leu Leu Pro Cys Leu Pro Leu Ala Thr Ala
Ala Pro Thr Arg His Pro Ile His Ile Lys Asp Gly Asp
Trp Asn Glu Phe Arg Arg Lys Leu Thr Phe Tyr Leu Lys
Thr Leu Glu Asn Ala Gln Ala Gln Gln [SEQ ID NO:13]

15

EXAMPLE 7

Construction of pMON5898

Plasmid pMON5851 DNA was digested with restriction enzymes *HindIII* and *NcoI* resulting in a 3695 base pair *NcoI,HindIII* fragment. The genetic elements derived from pMON5851 are the beta-lactamase gene (AMP), pBR327 origin of replication, phage f1 origin of replication as the transcription terminator, AraBAD promoter, g10L ribosome binding site and the *lamB* secretion leader. The AraBAD promoter is identical to that described in plasmid pMON6235 and the *lamB* signal peptide sequence used is that shown in Figure 8 fused to hIL-3 at the *NcoI* recognition site. Plasmid pMON5873 DNA was digested with restriction enzymes *HindIII* and *NcoI* resulting in a 408 base pair *NcoI,HindIII* fragment. The genetic element derived from pMON5873 is the hIL-3 gene (1-133). Clones containing the hIL-3 (1-133) gene contained a 408 base pair *NcoI, HindIII* restriction fragment. This construct 35 was designated pMON5898.

EXAMPLE 8

Construction of pMON5987

Plasmid pMON6458 DNA was digested with restriction enzymes NcoI and HindIII, resulting in a 3940 base pair 5 NcoI, HindIII fragment. The genetic elements derived from pMON6458 are the beta-lactamase gene (AMP), pBR327 origin of replication, phage f1 origin of replication as the transcription terminator, AraBAD promoter, g10L ribosome binding site and lamB secretion leader. Plasmid pMON5978 10 DNA was digested with NcoI and NsiI. The resulting 170 base pair NcoI, NsiI fragment encodes amino acids 15-71 of (15-125)hIL-3. Plasmid pMON5976 DNA was digested with NsiI and HindIII. The resulting 175 base pair 15 NsiI, HindIII fragment encodes amino acids 72-125 of (15-125)hIL-3. The restriction fragments were ligated, and the ligation reaction mixture was used to transform E. coli K-12 strain JM101. Transformant bacteria were selected on ampicillin-containing plates. Plasmid DNA was isolated and screened for the restriction sites EcoRV 20 and NheI and DNA sequenced to confirm the correct insert.

EXAMPLE 9Construction of pMON5988

25 The plasmid DNA of pMON5987 was digested with NheI and EcoRI, resulting in a 3903 base pair NheI, EcoRI fragment. The 3903 base pair NheI, EcoRI fragment was ligated to 1.0 picomoles of the following annealed 30 oligonucleotides (Oligo #3 and Oligo #4):

5'-CTAGCCACGGCCGCACCCACCGCGACATCCAATCCATATCAA-
3'-GGTGCCGGCGTGGGTGCGCTGTAGGTTAGGTATAGTT-

35 GGACGGTGACTGGAATG-3' [SEQ ID NO:131]
CCTGCCACTGACCTTACAATT-5' [SEQ ID NO:132]

The ligation reaction mixture was used to transform

E. coli K-12 strain JM101 and transformant bacteria were selected on ampicillin-containing plates. Plasmid DNA was isolated and sequenced to confirm positive clones. This plasmid was constructed to change alanine 101 to 5 aspartic acid in the hIL-3 gene (15-125). The Ala101 to Asp101 change was confirmed by DNA sequencing. This plasmid was designated pMON5988 and encodes Peptide #1 [SEQ ID NO:65].

10

EXAMPLE 10Construction of pMON5873 which encodes [Met-(1-133)hIL-31

The gene obtained from British Biotechnology, Ltd. 15 specified arginine at codon position 129. The amino acid specified in the native hIL-3 cDNA is serine. To produce a protein with the native sequence at this position, the portion of the coding sequence between the EcoRI site at codons 106 and 107 and the NheI site at codons 129 and 20 130 was replaced. Plasmid DNA of pMON5854 (Example 3) and pMON5853 (Example 64) were treated with EcoRI and NheI. The larger fragments of each were gel purified. These were ligated to a pair of an annealed oligonucleotides with the following sequences:

25

5'-AATTCCGTCGTAAACTGACCTTCTATCTGAAAACC-
3'-GGCAGCATTGACTGGAAAGATAGACTTTGG-

30 TTGGAGAACGCGCAGGCTAACAGACCACTCTGTCG-3' [SEQ ID NO: 136]
AACCTCTTGCAGCGTCCGAGTTGTCTGGTGAGACAGCGATC-5' [SEQ ID
NO:137]

The ligation reaction mixtures were used to transform competent JM101 cells to ampicillin resistance. Colonies were picked into broth and grown. Plasmid DNA 35 was isolated and screened for the presence of a new StyI recognition site present in the synthetic DNA and not in pMON5854 and pMON5853. The nucleotide sequence of the gene in the region between EcoRI and NheI was determined

150

and found to be that of the synthetic oligonucleotides. The new plasmids were designated pMON5873 encoding [Met-(1-133)hIL-3] and pMON5872 encoding [Met-(15-133)hIL-3].

5 The plasmid, pMON5873, encodes Met-(1-133)hIL-3 which has the following amino acid sequence:

Met Ala Pro Met Thr Gln Thr Thr Ser Leu Lys Thr Ser
Trp Val Asn Cys Ser Asn Met Ile Asp Glu Ile Ile Thr
His Leu Lys Gln Pro Pro Leu Pro Leu Leu Asp Phe Asn
10 Asn Leu Asn Gly Glu Asp Gln Asp Ile Leu Met Glu Asn
Asn Leu Arg Arg Pro Asn Leu Glu Ala Phe Asn Arg Ala
Val Lys Ser Leu Gln Asn Ala Ser Ala Ile Glu Ser Ile
Leu Lys Asn Leu Leu Pro Cys Leu Pro Leu Ala Thr Ala
Ala Pro Thr Arg His Pro Ile His Ile Lys Asp Gly Asp
15 Trp Asn Glu Phe Arg Arg Lys Leu Thr Phe Tyr Leu Lys
Thr Leu Glu Asn Ala Gln Ala Gln Thr Thr Leu Ser
Leu Ala Ile Phe [SEQ ID NO:128]

EXAMPLE 11

20

Construction of pMON6458

Plasmid pMON6525 DNA was digested with restriction enzymes HindIII and SalI and the resulting 3172 base pair fragment was isolated from a 1% agarose gel by interception onto DEAE membrane. The genetic elements derived from pMON6525 are the beta-lactamase gene (AMP), pBR327 origin of replication, and phage f1 origin of replication as the transcription terminator. (The 25 genetic elements derived from plasmid pMON6525 are identical to those in plasmid pMON2341 which could also be used to construct pMON6458.) Plasmid pMON6457 was digested with restriction enzymes HindIII and SalI and the resulting 1117 base pair fragment was isolated by 30 PAGE and crush and soak elution. The genetic elements derived from pMON6457 are the pAraBAD promoter, g10L 35 ribosome binding site, lamB secretion leader and the (15-125) hIL-3 gene. The restriction fragments were ligated

and the ligation reaction mixture was used to transform *E. coli* K-12 strain JM101. Transformant bacteria were selected on ampicillin-containing plates. Plasmid DNA was isolated and the size of the inserted fragment was determined by restriction analysis employing restriction enzymes NcoI and HindIII in double digest. Clones containing the hIL-3 gene (encoding amino acids 15-125) contained a 345 base pair NcoI, HindIII restriction fragment. This construct was designated pMON6458. This plasmid was constructed to eliminate an EcoRI restriction site outside the hIL-3 gene coding region in plasmid pMON6457.

EXAMPLE 12

15 Construction of pMON6455

Plasmid pMON5905 DNA was digested with restriction enzymes HindIII and NcoI resulting in a 3936 base pair fragment. The genetic elements derived from pMON5905 are the beta-lactamase gene (AMP), pBR327 origin of replication, pAraBAD promoter, g10L ribosome binding site, lamB secretion leader and phage f1 origin of replication as the transcription terminator. The following genetic elements; beta-lactamase gene (AMP), pBR327 origin of replication, g10L ribosome binding site and phage f1 origin of replication as the transcription terminator, derived from plasmid pMON5905 are identical to those in plasmid pMON5594 which could also be used to construct pMON6455. The AraBAD promoter is identical to that described in pMON6235. The lamB signal peptide sequence used in pMON6455 is that shown in Figure 8 fused to hIL-3 (15-125) at the NcoI site. Plasmid pMON5887 DNA was digested with restriction enzymes HindIII and NcoI, resulting in a 384 base pair NcoI, HindIII fragment. The restriction fragments were ligated, and the ligation reaction mixture was used to transform into *E. coli* K-12 strain JM101. Transformant bacteria were selected on ampicillin-containing plates. Plasmid DNA was isolated

152

and the size of the inserted fragment was determined by restriction analysis employing restriction enzymes NcoI and HindIII in double digest. Positive clones containing the hIL-3 gene (encoding amino acids 1-125) contained a 5 384 base pair NcoI, HindIII restriction fragment. This construct was designated pMON6455.

EXAMPLE 1310 Construction of pMON6456

Plasmid pMON5905 DNA was digested with restriction enzymes HindIII and NcoI resulting in a 3936 base pair fragment. The genetic elements derived from pMON5905 are 15 the beta-lactamase gene (AMP), pBR327 origin of replication, phage f1 origin of replication as the transcription terminator, pAraBAD promoter, g10L ribosome binding site and the lamB secretion leader. Plasmid pMON5871 was digested with restriction enzymes HindIII 20 and NcoI, resulting in a 330 base pair NcoI, HindIII fragment. The genetic element derived from pMON5871 encompassed the bases encoding the (1-107) hIL-3 gene. The restriction fragments were ligated, and the ligation reaction mixture was used to transform *E. coli* K-12 25 strain JM101. Transformant bacteria were selected on ampicillin-containing plates. Plasmid DNA was isolated and the size of the inserted fragment was determined by restriction analysis employing restriction enzymes NcoI and HindIII in double digest. Clones containing the 30 hIL-3 gene (encoding amino acids 1-107) contained a 330 base pair NcoI, HindIII restriction fragment. This construct was designated pMON6456.

EXAMPLE 14

35

Construction of pMON6457

Plasmid pMON6455 DNA grown in *E. coli* strain GM48

(dam-) was digested with restriction enzymes NcoI and ClaI, resulting in a 4263 base pair NcoI, ClaI fragment. The restriction fragment was ligated to 1.0 picomoles of annealed oligonucleotides (Oligo #5 and Oligo #6) with 5 the following sequence coding for Met Ala 14-20 hIL-3:

5'-CATGGCTAACTGCTCTAACATGAT-3' [SEQ ID NO:151]

3'-CGATTGACGAGATTGTACTAGC-5' [SEQ ID NO:152]

10 The resulting DNA was transformed into *E. coli* K-12 strain JM101 and transformant bacteria were selected on ampicillin-containing plates. Plasmid DNA was isolated and the size of the inserted fragment was determined by restriction analysis employing restriction enzymes XbaI 15 and EcoRI in double digest. Positive clones containing the hIL-3 gene (encoding aa 15-125 of hIL-3) contained a 433 base pair XbaI, EcoRI restriction fragment and were DNA sequenced. This construct was designated pMON6457. This plasmid was constructed to delete the first 14 amino 20 acids of hIL-3. The coding sequence of the resulting gene begins as follows:

5' ATG GCT AAC TGC... 3' [SEQ ID NO:153]

Met Ala Asn Cys... [SEQ ID NO:154]

25 15

The first two amino acids (Methionine, Alanine) create an NcoI restriction site and a signal peptidase cleavage site between the lamB signal peptide and (15-125) hIL-3. 30 Plasmid pMON6457 encodes (15-125) hIL-3 which has the amino acid sequence designated SEQ ID NO:65.

EXAMPLE 15

35 Construction of pMON6235

One of the DNA fragments used to create this plasmid was generated by site-directed mutagenesis employing PCR

techniques described previously using the following oligonucleotides, Oligo #51(A) [SEQ ID NO:155] and Oligo #52(A) [SEQ ID NO:156], were used as primers in this procedure. The template for the PCR reaction was *E. coli* strain W3110 chromosomal DNA, prepared as described in Maniatis (1982). The oligonucleotide primers were designed to amplify the AraBAD promoter (Greenfield et al., 1978). The resulting DNA product was digested with the restriction enzymes SacII and BglII. The reaction mixture was purified as described previously. Plasmid, pMON5594, DNA was digested with SacII and BglII, resulting in a 4416 base pair SacII,BglII restriction fragment which contains the following genetic elements; beta-lactamase gene (AMP), pBR327 origin of replication, G10L ribosome binding site, phage f1 origin of replication as the transcription terminator and the chloramphenicol acetyl transferase (cat) gene. The 4416 base pair SacII,BglII restriction fragment from pMON5594 was ligated to the PCR-generated SacII, BglII DNA fragment. The ligation mixture was used to transform *E. coli* K-12 strain JM101. Positive clones contained a 323 base pair SacII,BglII fragment and were DNA sequenced to confirm that the SacII,BglII fragment was the AraBAD promoter. This construct was designated pMON6235.

25

EXAMPLE 16Construction of pMON6460

30 One of the DNA fragments to construct this plasmid was generated by site-directed mutagenesis employing PCR techniques described previously using the oligonucleotides, Oligo #7 [SEQ ID NO: 26] and Oligo #8 [SEQ ID NO: 27] as primers. The template for the PCR reaction was plasmid pMON6458 DNA. The resulting DNA product was digested with the restriction enzymes *NcoI* and *EcoRI*. Upon completion, the digest was heated at 70°C for 15 minutes to inactivate the enzymes. The

restriction fragment was purified by phenol/chloroform extraction and precipitation with equal volume isopropanol in the presence of 2M NH₄OAc. The oligonucleotide, Oligo #8, introduces two stop codons 5 (TAA) after amino acid 93 of hIL-3 and creates a *SalI* restriction endonuclease recognition sequence. The *NcoI*, *EcoRI* restriction fragment from pMON6458 was ligated to the PCR-generated *NcoI*, *EcoRI* restriction fragment. Positive clones containing the above mentioned changes 10 released a 1023 base pair *SalI* fragment. This construct was designated pMON6460. This plasmid was constructed to serve as the template for the creation of single amino acid substitution variants at positions 94, 95, 96 and 97 of hIL-3.

15

EXAMPLE 17Construction of pMON6461

20 One of the DNA fragments to create this plasmid was generated by site-directed mutagenesis employing PCR techniques described previously using the following oligonucleotide, Oligo #7 [SEQ. ID NO: 26] and Oligo #9 [SEQ. ID NO: 28], as primers. The template for the PCR 25 reaction was plasmid pMON6458 DNA. The resulting DNA product was digested with the restriction enzymes *NcoI* and *EcoRI*. The oligonucleotide, Oligo #9, introduces two stop codons (TAA) after amino acid 97 of hIL-3 and creates a *SalI* restriction endonuclease recognition sequence. The *NcoI*, *EcoRI* restriction fragment from 30 pMON5458 was ligated to the PCR-generated *NcoI*, *EcoRI* DNA fragment. Positive clones containing the above mentioned changes released a 1035 base pair *SalI* fragment. This construct was designated pMON6461. This plasmid was 35 constructed to serve as the template for the creation of single amino acid substitution variants at positions 98, 99, 100 and 101 of hIL-3.

EXAMPLE 18Construction of pMON6462

5 One of the DNA fragments to create this plasmid was generated by site-directed mutagenesis employing PCR techniques described previously using the following oligonucleotide, Oligo #7 [SEQ. ID NO: 26] and Oligo #10 [SEQ. ID NO: 31], as primers. The template for the PCR
10 reaction was plasmid pMON6458 DNA. The resulting DNA product was digested with the restriction enzymes *NcoI* and *EcoRI*. The oligonucleotide, Oligo #10 [SEQ. ID NO: 31] introduces two stop codons (TAA) after amino acid 101 of hIL-3 and creates a *Sall* restriction endonuclease
15 recognition sequence. The *NcoI*, *EcoRI* restriction fragment from pMON5458 was ligated to the PCR-generated *NcoI*, *EcoRI* DNA fragment. Positive clones containing the above mentioned changes released a 1047 base pair *Sall* fragment. This construct was designated pMON6462. This
20 plasmid was constructed to serve as the template for the creation of single amino acid substitution variants at positions 102, 103, 104 and 105 of hIL-3.

EXAMPLE 19

25

Construction of single amino acid substitution libraries at positions 94, 95, 96 and 97

One of the DNA fragments used to construct the plasmids
30 containing single amino acid substitution at positions 94, 95, 96 and 97 was generated by site-directed mutagenesis employing PCR techniques described previously. In the PCR reaction plasmid pMON6460 DNA was the template and the oligonucleotide, Oligo #7 [SEQ. ID NO: 26], was used as the primer at the N-terminus. The degenerate oligonucleotides, Oligo #11 [SEQ. ID NO: 32], Oligo #12 [SEQ. ID NO: 33], Oligo #13 [SEQ. ID NO: 34] and Oligo #14 [SEQ. ID NO: 35], were the primers at the
35

C-terminus. These oligonucleotides are 32-fold degenerate, with G, A, T or C in the first and second positions and G or C in the third position of a single codon at amino acid positions 94, 95, 96 and 97 of hIL-3 respectively. These degenerate oligonucleotide primers theoretically contain 32 different codons encoding all 20 amino acid substitutions and one translational stop codon at a single position. The degenerate oligonucleotides (Oligo #11 [SEQ. ID NO: 32], Oligo #12 [SEQ. ID NO: 33], 10 Oligo #13 [SEQ. ID NO: 34] and Oligo #14 [SEQ. ID NO: 35]) replace the twelve bases introduced into pMON6460, that encode the two stop codons (TAA) after amino acid 93 of hIL-3 and the *SalI* recognition sequence. At the other 9 bases the DNA sequence was restored to encode the 15 native hIL-3 protein sequence. The resulting PCR-generated DNA products were digested with the restriction enzymes *NcoI* and *EcoRI*. The 4008 bp *NcoI*, *EcoRI* restriction fragment from pMON6460 was ligated to the PCR-generated *NcoI*, *EcoRI* DNA fragments. Plasmid DNA 20 from individual colonies was isolated as described previously and screened by DNA dot blot differential hybridization using the oligonucleotide, Oligo #15 [SEQ. ID NO: 36], as the probe which had been labeled with λ P₃₂. Clones shown to be positive by hybridization were 25 selected, plasmid DNA isolated and DNA sequenced to determine the amino acid substitution.

EXAMPLE 20

30 Construction of single amino acid substitution libraries at positions 98, 99, 100 and 101

Single amino acid substitutions variants were constructed at position 98, 99, 100 and 101 as described previously, 35 with the following changes. In the PCR reaction the template was plasmid pMON6461 DNA and the oligonucleotide, Oligo #7 [SEQ. ID NO: 26], was used as the primer at the N-terminus. The degenerate

oligonucleotides, Oligo #16 [SEQ. ID NO: 37], Oligo #17 [SEQ. ID NO: 38], Oligo #18 [SEQ. ID NO: 39] and Oligo #19 [SEQ. ID NO: 40], were used as primers at the C-terminus. The resulting PCR-generated DNA products were 5 purified and digested with restriction enzymes *NcoI* and *EcoRI*. The 4008 bp *NcoI*, *EcoRI* restriction fragment from pMON6461 was ligated to the PCR-generated DNA *NcoI*, *EcoRI* restriction fragment. Single colonies were screened by DNA dot blot differential hybridization using the 10 oligonucleotide, Oligo #20 [SEQ. ID NO: 41], as the probe. Clones shown to be positive by hybridization were selected, plasmid DNA isolated and DNA sequenced to determine the amino acid substitution.

15

EXAMPLE 21Construction of single amino acid substitution libraries at positions 102, 103, 104 and 105

20 Single amino acid substitutions variants were constructed at position 102, 103, 104 and 105 as described previously, with the following changes. The template was pMON6462 and the oligonucleotide, Oligo #7 [SEQ. ID NO: 26], was used as the primer at the N-terminus. The 25 degenerate oligonucleotides, Oligo #21 [SEQ. ID NO: 42], Oligo #22 [SEQ. ID NO: 43], Oligo #23 [SEQ. ID NO: 44] and Oligo #24 [SEQ. ID NO: 45] were used as primers at the C-terminus. The resulting PCR-generated DNA products were purified and digested with restriction enzymes, *NcoI* 30 and *EcoRI*. The 4008 bp *NcoI*, *EcoRI* restriction fragment from pMON6462 was ligated to the PCR-generated *NcoI*, *EcoRI* restriction fragment. Single colonies were screened by DNA dot blot differential hybridization using the oligonucleotide, Oligo #25 [SEQ. ID NO: 46], as the 35 probe. Clones shown to be positive by hybridization were selected, plasmid DNA isolated and DNA sequenced to determine the amino acid substitution.

EXAMPLE 22Construction of plasmid pMON6464

5 Amino acids 17-22 of hIL-3 were deleted using site-directed PCR mutagenesis methods described previously. Plasmid pMON6458 DNA was the template in the PCR reaction using the oligonucleotides, Oligo #26 and Oligo #27 as primers. The resulting PCR-generated DNA products were
10 purified and digested with *NcoI* and *EcoRI*. The 4008 bp *NcoI*, *EcoRI* restriction fragment from pMON6458 was ligated to the PCR-generated *NcoI*, *EcoRI* restriction fragment. Positive clones contained a 263 base pair *NcoI*, *EcoRI* restriction fragment in which the bases
15 encoding amino acids 17-22 of hIL-3 have been deleted. pMON6464 was made to serve as the template for the creation of single amino acid substitution variants at positions 17, 18, 19, 20, 21 and 22 of hIL-3.

20

EXAMPLE 23Construction of plasmid pMON6465

Amino acids 23-28 of hIL-3 were deleted using site-directed PCR mutagenesis methods described previously.
25 Plasmid pMON6458 DNA was the template in the reaction using the oligonucleotides, Oligo # 26 and Oligo #28, as primers. The resulting PCR-generated DNA product was purified and digested with *NcoI* and *EcoRI*. The 4008 bp
30 *NcoI*, *EcoRI* restriction fragment from pMON6458 was ligated to the PCR-generated *NcoI*, *EcoRI* restriction fragment. Positive clones contained a 263 base pair *NcoI*, *EcoRI* restriction fragment in which the bases encoding amino acids 23-28 of hIL-3 have been deleted.
35 pMON6465 was made to serve as the template for the creation of single amino acid substitution variants at positions 23, 24, 25, 26, 27 and 28 of hIL-3.

EXAMPLE 24Construction of plasmid pMON6466

5 Amino acids 29-34 of hIL-3 were deleted using site-directed PCR mutagenesis methods described previously. Plasmid pMON6458 DNA was the template in the reaction using the oligonucleotides, Oligo #26 and Oligo #29 as the primers. The resulting PCR-generated DNA product was
10 purified and digested with *NcoI* and *EcoRI*. The 4008 bp *NcoI*, *EcoRI* restriction fragment from pMON6458 was ligated to the PCR-generated *NcoI*, *EcoRI* restriction fragment. Positive clones contained a 263 base pair *NcoI*, *EcoRI* restriction fragment in which the bases
15 encoding amino acids 29-34 of hIL-3 have been deleted. pMON6466 was made to serve as the template for the creation of single amino acid substitution variants at positions 29, 30, 31, 32, 33 and 34 of hIL-3.

20 EXAMPLE 25Construction of plasmid pMON6467

Amino acids 35-40 of hIL-3 were deleted using site-directed PCR mutagenesis methods described previously.
25 Plasmid pMON5988 DNA was the template in the reaction using the oligonucleotides, Oligo #7 and Oligo #30, as primers. The resulting PCR-generated DNA product was purified and digested with *NcoI* and *EcoRV*. The *NcoI*,
30 *EcoRV* restriction fragment from pMON5988 was ligated to the PCR-generated *NcoI*, *EcoRV* restriction fragment. Positive clones contained a 81 base pair *NcoI*, *EcoRV* restriction fragment in which the bases encoding amino acids 35-40 of hIL-3 have been deleted. pMON6467 was
35 made to serve as the template for the creation of single amino acid substitution variants at positions 35, 36, 37, 38, 39 and 40 of hIL-3.

EXAMPLE 26Construction of plasmid pMON6468

5 Amino acids 41-46 of hIL-3 were deleted using site-directed PCR mutagenesis methods described previously. Plasmid pMON5988 DNA was the template in the reaction using the oligonucleotides, Oligo #7 and Oligo #31, as the primers. The resulting PCR-generated DNA product was
10 purified and digested with *NcoI* and *XhoI*. The *NcoI*, *XhoI* restriction fragment from pMON5988 was ligated to the PCR-generated *NcoI*, *XhoI* restriction fragment. Positive clones contained a 119 base pair *NcoI*, *XhoI* restriction fragment in which the bases encoding amino acids 41-46 of
15 hIL-3 have been deleted. pMON6468 was made to serve as the template for the creation of single amino acid substitution variants at positions 41, 42, 43, 44, 45 and 46 of hIL-3.

EXAMPLE 27Construction of plasmid pMON6469

Amino acids 47-52 of hIL-3 were deleted using site-directed PCR mutagenesis methods described previously.
25 Plasmid pMON5988 DNA was the template in the reaction using the oligonucleotides, Oligo #7 and Oligo #32, as the primers. The resulting PCR-generated DNA product was purified and digested with *NcoI* and *XhoI*. The *NcoI*, *XhoI* restriction fragment from pMON5988 was ligated to the PCR-generated *NcoI*, *XhoI* restriction fragment. Positive clones contained a 119 base pair *NcoI*, *XhoI* restriction fragment in which the bases encoding amino acids 47-52 of hIL-3 have been deleted. pMON6469 was made to serve as
30 the template for the creation of single amino acid substitution variants at positions 47, 48, 49, 50, 51 and 52 of hIL-3.

EXAMPLE 28Construction of plasmid pMON6470

5 Amino acids 53-58 of hIL-3 were deleted using site-directed PCR mutagenesis methods described previously. Plasmid, pMON5988, DNA was the template in the reaction using the oligonucleotides, Oligo # 7 and Oligo #33, as primers. The resulting PCR-generated DNA product was
10 purified and digested with *NcoI* and *NsiI*. The *NcoI*, *NsiI* restriction fragment from pMON5988 was ligated to the PCR-generated *NcoI*, *NsiI* restriction fragment. Positive clones contained a 152 base pair *NcoI*, *NsiI* restriction fragment in which the bases encoding amino acids 53-58 of
15 hIL-3 have been deleted. pMON6470 was made to serve as the template for the creation of single amino acid substitution variants at positions 53, 54, 55, 56, 57 and 58 of hIL-3.

20

EXAMPLE 29Construction of plasmid pMON6471

Amino acids 59-64 of hIL-3 were deleted using site-directed PCR mutagenesis methods described previously.
25 Plasmid pMON5988 DNA was the template in the reaction using the oligonucleotides, Oligo #7 and Oligo #34, as the primers. The resulting PCR-generated DNA product was purified and digested with *NcoI* and *NsiI*. The *NcoI*, *NsiI* restriction fragment from pMON5988 was ligated to the PCR-generated *NcoI*, *NsiI* restriction fragment. Positive clones contained a 152 base pair *NcoI*, *NsiI* restriction fragment in which the bases encoding amino acids 59-64 of hIL-3 have been deleted. pMON6471 was made to serve as
30 the template for the creation of single amino acid substitution variants at positions 59, 60, 61, 62, 63 and 64 of hIL-3.
35

EXAMPLE 30Construction of plasmid pMON6472

5 Amino acids 65-70 of hIL-3 were deleted using site-directed PCR mutagenesis methods described previously. Plasmid pMON5988 DNA was the template in the reaction using the oligonucleotides, Oligo # 26 and Oligo # 35, as primers. The resulting PCR-generated DNA product was
10 purified and digested with *EcoRI* and *XhoI*. The *EcoRI*, *XhoI* restriction fragment from pMON5988 was ligated to the PCR-generated *EcoRI*, *XhoI* restriction fragment. Positive clones contained a 126 base pair *EcoRI*, *XhoI* restriction fragment in which the bases encoding amino
15 acids 65-70 of hIL-3 have been deleted. pMON6472 was made to serve as the template for the creation of single amino acid substitution variants at positions 65, 66, 67, 68, 69 and 70 of hIL-3.

20

EXAMPLE 31Construction of plasmid pMON6473

Amino acids 71-76 of hIL-3 were deleted using site-directed PCR mutagenesis methods described previously.
25 Plasmid, pMON5988, DNA was the template in the reaction using the oligonucleotides, Oligo #26 and Oligo #36, as primers. The resulting PCR-generated DNA product was and digested with *PstI* and *EcoRI*. The *PstI*, *EcoRI*
30 restriction fragment from pMON5988 was ligated to the PCR-generated *PstI*, *EcoRI* restriction fragment. Restriction analysis was with *NcoI*, *NsiI* and *EcoRI* in a triple digest. Positive clones contained a 263 base pair
35 *NcoI*, *EcoRI* restriction fragment, in which the bases encoding amino acids 71-76 of hIL-3 have been deleted, and lost the *NsiI* restriction site. pMON6473 was made to serve as the template for the creation of single amino acid substitution variants at positions 71, 72, 73, 74,

75 and 76 of hIL-3.

EXAMPLE 32

5 Construction of plasmid pMON6474

Amino acids 77-82 of hIL-3 were deleted using site-directed PCR mutagenesis methods described previously. Plasmid pMON5988 DNA was the template in the reaction 10 using the oligonucleotides, Oligo #26 and Oligo #37, as primers. The resulting PCR-generated DNA product was purified and digested with *PstI* and *EcoRI*. The *PstI*, *EcoRI* restriction fragment from pMON5988 was ligated to the PCR-generated *PstI*, *EcoRI* restriction fragment. 15 Restriction analysis was with *NcoI*, *NsiI* and *EcoRI* in a triple digest. Positive clones contained a 170 base pair *NcoI*, *NsiI* restriction fragment and a 93 base pair *NsiI*, *EcoRI* restriction fragment in which the bases encoding amino acids 77-82 of hIL-3 have been deleted. pMON6474 20 was made to serve as the template for the creation of single amino acid substitution variants at positions 77, 78, 79, 80, 81 and 82 of hIL-3.

EXAMPLE 33

25

Construction of plasmid pMON6475

Amino acids 83-88 of hIL-3 were deleted using site-directed PCR mutagenesis methods described previously. 30 Plasmid pMON5988 DNA was the template in the reaction using the oligonucleotides, Oligo #26 and Oligo #38, as primers. The resulting PCR-generated DNA product was digested with *PstI* and *EcoRI*. The *PstI*, *EcoRI* restriction fragment from pMON5988 was ligated to the 35 PCR-generated *PstI*, *EcoRI* restriction fragment. Restriction analysis was with *NcoI*, *NsiI* and *EcoRI* in a triple digest. Positive clones contained a 170 base pair *NcoI*, *NsiI* restriction fragment and a 93 base pair *NsiI*,

EcoRI restriction fragment in which the bases encoding amino acids 83-88 of hIL-3 have been deleted. pMON6475 was made to serve as the template for the creation of single amino acid substitution variants at positions 83, 5 84, 85, 86, 87 and 88 of hIL-3.

EXAMPLE 34

Construction of plasmid pMON6476

10 Amino acids 88-93 of hIL-3 were deleted using site-directed PCR mutagenesis methods described previously. Plasmid pMON6458 DNA was the template in the reaction using the oligonucleotides, Oligo #7 and Oligo #39, as 15 primers. The resulting PCR-generated DNA product was purified and digested with NcoI and EcoRI. The NcoI, EcoRI restriction fragment from pMON6458 was ligated to the PCR-generated NcoI, EcoRI restriction fragment. Positive clones contained a 263 base pair NcoI, EcoRI 20 restriction fragment in which the bases encoding amino acids 88-93 of hIL-3 have been deleted. pMON6476 was made to serve as the template for the creation of single amino acid substitution variants at positions 88, 89, 90, 91, 92 and 93 of hIL-3.

25

EXAMPLE 35

Construction of plasmid pMON6477

30 Amino acids 106-111 of hIL-3 were deleted using site-directed PCR mutagenesis methods described previously. Plasmid pMON6458 DNA was the template in the reaction using the oligonucleotides, Oligo #7 and Oligo #40, as 35 primers. The resulting PCR-generated DNA fragment was purified and digested with NcoI and HindIII. The NcoI, HindIII restriction fragment from pMON6458 was ligated to the PCR-generated NcoI, HindIII restriction fragment. Positive clones contained a 327 base pair NcoI, HindIII

restriction fragment in which the bases encoding amino acids 106-111 of hIL-3 have been deleted. pMON6477 was made to serve as the template for the creation of single amino acid substitution variants at positions 106, 107,
5 108, 109, 110 and 111 of hIL-3.

EXAMPLE 36

Construction of plasmid pMON6478

10

Amino acids 112-117 of hIL-3 were deleted using site-directed PCR mutagenesis methods described previously. Plasmid pMON6458 DNA was the template in the reaction using the oligonucleotides, Oligo #7 and Oligo #41, as
15 primers. The resulting PCR-generated DNA product was purified and digested with *NcoI* and *HindIII*. The 4008 bp *NcoI*, *HindIII* restriction fragment from pMON6458 was ligated to the PCR-generated *NcoI*, *HindIII* restriction fragment. Positive clones contained a 327 base pair
20 *NcoI*, *HindIII* restriction fragment in which the bases encoding amino acids 112-117 of hIL-3 have been deleted. pMON6478 was made to serve as the template for the creation of single amino acid substitution variants at positions 112, 113, 114, 115, 116 and 117 of hIL-3.

25

EXAMPLE 37

Construction of plasmid pMON6479

30 Amino acids 118-123 of hIL-3 were deleted using site-directed PCR mutagenesis methods described previously. Plasmid pMON6458 DNA was the template in the reaction using the oligonucleotides, Oligo #7 and Oligo #42, as
35 primers. The resulting PCR-generated DNA product was purified and digested with *NcoI* and *HindIII*. The *NcoI*, *HindIII* restriction fragment from pMON6458 was ligated to the PCR-generated *NcoI*, *HindIII* restriction fragment. Positive clones contained a 327 base pair *NcoI*, *HindIII*

restriction fragment in which the bases encoding amino acids 118-123 of hIL-3 have been deleted. pMON6479 was made to serve as the template for the creation of single amino acid substitution variants at positions 118, 119, 5 120, 121, 122 and 123 of hIL-3.

EXAMPLE 38

10 Construction of single amino acid substitution libraries
at positions 17, 18, 19, 20, 21 and 22

One of the DNA fragments used to construct the plasmids containing single amino acid substitutions at positions 17, 18, 19, 20, 21 and 22 of hIL-3 was generated by site-directed mutagenesis employing PCR techniques described previously. In the PCR reaction the plasmid pMON6464 DNA was the template and the following 32 fold degenerate oligonucleotides, Oligo #43, Oligo #44, Oligo #45, Oligo 15 #46, Oligo #47 and Oligo #48 were the primers at the C-terminus. The oligonucleotide, Oligo #26, was used as the primer at the N-terminus. The degenerate oligonucleotides replace the eighteen bases, encoding six amino acids, deleted in pMON6464. The degenerate oligonucleotides have G, A, T or C in the first and 20 second positions and G or C in the third position of a single codon at amino acid positions 17, 18, 19, 20, 21 and 22 of hIL-3 respectively. These degenerate oligonucleotide primers result in libraries which 25 theoretically contain 32 different codons encoding all 20 amino acid substitutions and one translational stop codon at one position. At the other five amino acid positions the native hIL-3 DNA sequence was restored. The resulting PCR-generated DNA product was digested with NcoI and EcoRV. Plasmid pMON6464 DNA was digested with 30 restriction enzymes NcoI and EcoRV resulting in a 4190 base pair fragment which was ligated to the PCR-generated NcoI, EcoRV restriction fragments. Plasmid DNA was 35 isolated and screened by DNA dot blot differential

hybridization using the oligonucleotide probe, Oligo #139, which had been labeled with P32. Clones shown to be positive by colony hybridization were selected, plasmid DNA isolated and DNA sequenced to determine the 5 amino acid substitution.

EXAMPLE 39

10 Construction of single amino acid substitution libraries at positions 23, 24, 25, 26, 27 and 28

One of the DNA fragments used to construct the plasmids containing single amino acid substitutions at positions 23, 24, 25, 26, 27 and 28 of hIL-3 was generated by site-directed mutagenesis employing PCR techniques described previously. In the PCR reaction the plasmid pMON6465 DNA was the template and the following 32 fold degenerate oligonucleotides, Oligo #49, Oligo #50, Oligo #51, Oligo #52, Oligo #53 and Oligo #54 were the primers at the 20 C-terminus. The oligonucleotide, Oligo #26, was used as the primer at the N-terminus. The degenerate oligonucleotides replace the eighteen bases, encoding six amino acids, deleted in pMON6465. The degenerate oligonucleotides have G, A, T or C in the first and 25 second positions and G or C in the third position of a single codon at amino acid positions 23, 24, 25, 26, 27 and 28 of hIL-3 respectively. These degenerate oligonucleotide primers result in libraries which theoretically contain 32 different codons encoding all 30 20 amino acid substitutions and one translational stop codon at one position. At the other five amino acid positions the native hIL-3 DNA sequence was restored. The resulting PCR-generated DNA products were purified and digested with restriction enzymes *NcoI* and *EcoRV*. 35 Plasmid pMON6465 DNA was digested with restriction enzymes *NcoI* and *EcoRV* and the resulting 4190 base pair fragment was ligated to the PCR-generated *NcoI*, *EcoRV* DNA fragments. Transformant bacteria were screened by DNA

dot blot differential hybridization using the oligonucleotide probe, Oligo #140, which had been labeled with p32. Clones shown to be positive by colony hybridization were selected, plasmid DNA isolated and DNA sequenced to determine the amino acid substitution.

EXAMPLE 40

Construction of single amino acid substitution libraries
10 at positions 29, 30, 31, 32, 33 and 34

One of the DNA fragments used to construct the plasmids containing single amino acid substitutions at positions 29, 30, 31, 32, 33 and 34 of hIL-3 was generated by site-directed mutagenesis employing PCR techniques described previously. In the PCR reaction the plasmid pMON6466 DNA was the template and the following 32 fold degenerate oligonucleotides, Oligo #55, Oligo #56, Oligo #57, Oligo #58, Oligo #59 and Oligo #60 were the primers at the C-terminus. The oligonucleotide Oligo #26 was used as the primer at the N-terminus. The degenerate oligonucleotides replace the eighteen bases, encoding six amino acids, deleted in pMON6466. The degenerate oligonucleotides have G, A, T or C in the first and second positions and G or C in the third position of a single codon at amino acid positions 29, 30, 31, 32, 33 and 34 of hIL-3 respectively. These degenerate oligonucleotide primers result in libraries which theoretically contain 32 different codons encoding all 20 amino acid substitutions and one translational stop codon at one position. At the other five amino acid positions the native hIL-3 DNA sequence was restored. The resulting PCR-generated DNA products were purified and digested with the restriction enzymes *NcoI* and *EcoRV*.
35 Plasmid pMON6466 DNA was digested with restriction enzymes *NcoI* and *EcoRV* and the resulting 4190 base pair fragment was ligated to the PCR-generated *NcoI*, *EcoRV* DNA fragments. Transformant bacteria were screened by DNA

170

dot blot differential hybridization using the oligonucleotide probe, Oligo #141, which had been labeled with P32. Clones shown to be positive by colony hybridization were selected, plasmid DNA isolated and DNA 5 sequenced to determine the amino acid substitution.

EXAMPLE 41Construction of single amino acid substitution libraries at positions 35, 36, 37, 38, 39 and 40

5

One of the DNA fragments used to construct the plasmids containing single amino acid substitutions at positions 35, 36, 37, 38, 39 and 40 of hIL-3 were generated by site-directed mutagenesis employing PCR techniques

10 described previously. In the PCR reaction the plasmid pMON6467 DNA was the template and the following 32 fold degenerate oligonucleotides, Oligo #61, Oligo #62, Oligo #63, Oligo #64, Oligo #65 and Oligo #66 were the primers at the C-terminus. The oligonucleotide, Oligo #7, was
15 used as the primer at the N-terminus. The degenerate oligonucleotides replace the eighteen bases, encoding six amino acids, deleted in pMON6467. The degenerate oligonucleotides have G, A, T or C in the first and second positions and G or C in the third position of a
20 single codon at amino acid positions 35, 36, 37, 38, 39 and 40 of hIL-3 respectively. These degenerate oligonucleotide primers result in libraries which theoretically contain 32 different codons encoding all 20 amino acid substitutions and one translational stop codon
25 at one position. At the other five amino acid positions the native hIL-3 DNA sequence was restored and at the other position, 32 different codons substitutions were created at positions independently. The resulting PCR-generated DNA products were purified and digested with
30 the restriction enzymes *NcoI* and *EcoRV*. Plasmid pMON6467 DNA was digested with restriction enzymes *NcoI* and *EcoRV* and the resulting 4190 base pair fragment was ligated to the PCR-generated *NcoI*, *EcoRV* DNA fragments.

Transformant bacteria were screened by DNA dot blot
35 differential hybridization using the oligonucleotide probe, Oligo #142, which had been labeled with P^{32} . Clones shown to be positive by colony hybridization were selected, plasmid DNA isolated and DNA sequenced to

determine the amino acid substitution.

EXAMPLE 42

5 Construction of single amino acid substitution libraries at positions 41, 42, 43, 44, 45 and 46

One of the DNA fragments used to construct the plasmids containing single amino acid substitutions at positions 10 41, 42, 43, 44, 45 and 46 of hIL-3 was generated by site-directed mutagenesis employing PCR techniques described previously. In the PCR reaction the plasmid pMON6468 DNA was the template and the following 32 fold degenerate oligonucleotides, Oligo #67, Oligo #68, Oligo #69, Oligo 15 #70, Oligo #71 and Oligo #72 were the primers at the C-terminus. The oligonucleotide, Oligo #7, was used as the primer at the N-terminus. The degenerate oligonucleotides replace the eighteen bases, encoding six amino acids, deleted in pMON6468. The degenerate 20 oligonucleotide primers result in libraries which theoretically contain 32 different codons encoding all 20 amino acid substitutions and one translational stop codon at one position. At the other five amino acid positions the native hIL-3 DNA sequence was restored. The resulting PCR-generated DNA products were purified and 25 digested with the restriction enzymes *NcoI* and *XhoI*. Plasmid pMON6468 DNA was digested with restriction enzymes *NcoI* and *XhoI* and the resulting 4152 base pair fragment was ligated to the PCR-generated *NcoI*, *XhoI* DNA 30 fragments. Transformant bacteria were screened by DNA dot blot differential hybridization using the oligonucleotide probe, Oligo #143, which had been labeled with P32. Clones shown to be positive by colony 35 hybridization were selected, plasmid DNA isolated and DNA

sequenced to determine the amino acid substitution.

EXAMPLE 43

5 Construction of single amino acid substitution libraries at positions 47, 48, 49, 50, 51 and 52

One of the DNA fragments used to construct the plasmids containing single amino acid substitutions at positions 10 47, 48, 49, 50, 51 and 52 of hIL-3 was generated by site-directed mutagenesis employing PCR techniques described previously. In the PCR reaction the plasmid pMON6469 DNA was the template and the following 32 fold degenerate oligonucleotides, Oligo #73, Oligo #74, Oligo #75, Oligo 15 #76, Oligo #77 and Oligo #78 , were the primers at the C-terminus. The oligonucleotide, Oligo #7, was used as the primer at the N-terminus. The degenerate oligonucleotides replace the eighteen bases, encoding six amino acids, deleted in pMON6469. The degenerate 20 oligonucleotides have G, A, T or C in the first and second positions and G or C in the third position of a single codon at amino acid positions 47, 48, 49, 50, 51 and 52 of hIL-3 respectively. These degenerate oligonucleotide primers result in libraries which 25 theoretically contain 32 different codons encoding all 20 amino acid substitutions and one translational stop codon at one position. At the other five amino acid positions the native hIL-3 DNA sequence was restored. The resulting PCR-generated DNA products were purified and 30 digested with the restriction enzymes *NcoI* and *XhoI*. Plasmid pMON6469 DNA was digested with restriction enzymes *NcoI* and *XhoI* and the resulting 4152 base pair fragment was ligated to the PCR-generated *NcoI*, *XhoI* DNA 35 fragments. Transformant bacteria were screened by DNA dot blot differential hybridization using the oligonucleotide probe, Oligo #144, which had been labeled with P32. Clones shown to be positive by colony hybridization were selected, plasmid DNA isolated and DNA

sequenced to determine the amino acid substitution.

EXAMPLE 44

5 Construction of single amino acid substitution libraries at positions 53, 54, 55, 56, 57 and 58

One of the DNA fragments used to construct the plasmids containing single amino acid substitutions at positions 10 53, 54, 55, 56, 57 and 58 of hIL-3 was generated by site-directed mutagenesis employing PCR techniques described previously. In the PCR reaction the plasmid pMON6470 DNA was the template and the following 32 fold degenerate oligonucleotides, Oligo #79, Oligo #80, Oligo #81, Oligo 15 #82, Oligo #83 and Oligo #84 , were the primers at the C-terminus. The oligonucleotide, Oligo #7, was used as the primer at the N-terminus. The degenerate oligonucleotides replace the eighteen bases, encoding six amino acids, deleted in pMON6470. The degenerate 20 oligonucleotides have G, A, T or C in the first and second positions and G or C in the third position of a single codon at amino acid positions 53, 54, 55, 56, 57 and 58 of hIL-3 respectively. These degenerate oligonucleotide primers result in libraries which 25 theoretically contain 32 different codons encoding all 20 amino acid substitutions and one translational stop codon at one position. At the other five amino acid positions the native hIL-3 DNA sequence was restored. The resulting PCR-generated DNA products were purified and 30 digested with the restriction enzymes *NcoI* and *NsiI*. Plasmid pMON6470 DNA was digested with restriction enzymes *NcoI* and *NsiI* and the resulting 4119 base pair fragment was ligated to the PCR-generated *NcoI*, *NsiI* DNA fragments. Transformant bacteria were screened by DNA 35 dot blot differential hybridization using the oligonucleotide probe, Oligo #145, which had been labeled with P^{32} . Clones shown to be positive by colony hybridization were selected, plasmid DNA isolated and DNA

sequenced to determine the amino acid substitution.

EXAMPLE 45

5 Construction of single amino acid substitution libraries at positions 59, 60, 61, 62, 63 and 64

One of the DNA fragments used to construct the plasmids containing single amino acid substitutions at positions 10 59, 60, 61, 62, 63 and 64 of hIL-3 was generated by site-directed mutagenesis employing PCR techniques described previously. In the PCR reaction the plasmid pMON6471 DNA was the template and the following 32 fold degenerate oligonucleotides, Oligo #85, Oligo #86, Oligo #87, Oligo 15 #88, Oligo #89 and Oligo #90 , were the primers at the C-terminus. The oligonucleotide, Oligo #7, was used as the primer at the N-terminus. The degenerate oligonucleotides replace the eighteen bases, encoding six amino acids, deleted in pMON6471. The degenerate 20 oligonucleotides have G, A, T or C in the first and second positions and G or C in the third position of a single codon at amino acid positions 59, 60, 61, 62, 63 and 64 of hIL-3 respectively. These degenerate oligonucleotide primers result in libraries which 25 theoretically contain 32 different codons encoding all 20 amino acid substitutions and one translational stop codon at one position. At the other five amino acid positions the native hIL-3 DNA sequence was restored. The resulting PCR-generated DNA products were purified and 30 digested with the restriction enzymes *NcoI* and *NsiI*. Plasmid pMON6471 DNA was digested with restriction enzymes *NcoI* and *NsiI* and the resulting 4119 base pair fragment was ligated to the PCR-generated *NcoI*, *NsiI* DNA fragments. Transformant bacteria were screened by DNA 35 dot blot differential hybridization using the oligonucleotide probe, Oligo #146, which had been labeled with P32. Clones shown to be positive by colony hybridization were selected, plasmid DNA isolated and DNA

sequenced to determine the amino acid substitution.

EXAMPLE 46

5 Construction of single amino acid substitution libraries at positions 65, 66, 67, 68, 69 and 70

One of the DNA fragments used to construct the plasmids containing single amino acid substitutions at positions 10 65, 66, 67, 68, 69 and 70 of hIL-3 was generated by site-directed mutagenesis employing PCR techniques described previously. In the PCR reaction the plasmid pMON6472 DNA was the template and the following 32 fold degenerate oligonucleotides, Oligo #91, Oligo #92, Oligo #93, Oligo 15 #94, Oligo #95 and Oligo #96 , were the primers at the N-terminus. The oligonucleotide, Oligo #26, was used as the primer at the C-terminus. The degenerate oligonucleotides replace the eighteen bases, encoding six amino acids, deleted in pMON6472. The degenerate 20 oligonucleotides have G, A, T or C in the first and second positions and G or C in the third position of a single codon at amino acid positions 65, 66, 67, 68, 69 and 70 of hIL-3 respectively. These degenerate oligonucleotide primers result in libraries which 25 theoretically contain 32 different codons encoding all 20 amino acid substitutions and one translational stop codon at one position. At the other five amino acid positions the native hIL-3 DNA sequence was restored. The resulting PCR-generated DNA products were purified and 30 digested with the restriction enzymes *EcoRI* and *XhoI*. Plasmid pMON6472 DNA was digested with restriction enzymes *EcoRI* and *XhoI* and the resulting 4145 base pair fragment was ligated to the PCR-generated *EcoRI*, *XhoI* DNA 35 fragments. Transformant bacteria were screened by DNA dot blot differential hybridization using the oligonucleotide probe, Oligo #147, which had been labeled with P32. Clones shown to be positive by colony hybridization were selected, plasmid DNA isolated and DNA

sequenced to determine the amino acid substitution.

EXAMPLE 47

5 Construction of single amino acid substitution libraries at positions 71, 72, 73, 74, 75 and 76

One of the DNA fragments used to construct the plasmids containing single amino acid substitutions at positions 10 71, 72, 73, 74, 75 and 76 of hIL-3 was generated by site-directed mutagenesis employing PCR techniques described previously. In the PCR reaction the plasmid pMON6473 DNA was the template and the following 32 fold degenerate oligonucleotides, Oligo #97, Oligo #98, Oligo #99, Oligo 15 #100, Oligo #101 and Oligo #102 , were the primers at the N-terminus. The oligonucleotide, Oligo #26, was used as the primer at the C-terminus. The degenerate oligonucleotides replace the eighteen bases, encoding six amino acids, deleted in pMON6473. The degenerate 20 oligonucleotide primers have G, A, T or C in the first and second positions and G or C in the third position of a single codon at amino acid positions 71, 72, 73, 74, 75 and 76 of hIL-3 respectively. These degenerate oligonucleotide primers result in libraries which 25 theoretically contain 32 different codons encoding all 20 amino acid substitutions and one translational stop codon at one position. At the other five amino acid positions the native hIL-3 DNA sequence was restored. The resulting PCR-generated DNA fragments were purified and 30 digested with the restriction enzymes *EcoRI* and *PstI*. Plasmid pMON6473 DNA was digested with restriction enzymes *EcoRI* and *PstI* and the resulting 4171 base pair fragment was ligated to the PCR-generated *EcoRI*, *PstI* DNA fragments. Transformant bacteria were screened by DNA 35 dot blot differential hybridization using the oligonucleotide probe, Oligo #148, which had been labeled with P³². Clones shown to be positive by colony hybridization were selected, plasmid DNA isolated and DNA

sequenced to determine the amino acid substitution.

EXAMPLE 48

5 Construction of single amino acid substitution libraries at positions 77, 78, 79, 80, 81 and 82

One of the DNA fragments used to construct the plasmids containing single amino acid substitutions at positions 10 77, 78, 79, 80, 81 and 82 of hIL-3 was generated by site-directed mutagenesis employing PCR techniques described previously. In the reaction the plasmid pMON6474 DNA was the template and the following 32 fold degenerate oligonucleotides, Oligo #103, Oligo #104, Oligo #105, 15 Oligo #106, Oligo #107 and Oligo #108 , were the primers at the N-terminus. The oligonucleotide, Oligo #26, was used as the primer at the C-terminus. The degenerate oligonucleotides replace the eighteen bases, encoding six amino acids, deleted in pMON6474. The degenerate 20 oligonucleotide primers result in libraries which 25 theoretically contain 32 different codons encoding all 20 amino acid substitutions and one translational stop codon at one position. At the other five amino acid positions the native hIL-3 DNA sequence was restored. The resulting PCR-generated DNA products were purified and 30 digested with the restriction enzymes *EcoRI* and *PstI* as described previosly. Plasmid pMON6474 DNA was digested with restriction enzymes *EcoRI* and *PstI* and the resulting 4171 base pair fragment was ligated to the PCR-generated *EcoRI*, *PstI* DNA fragments. Transformant bacteria were 35 screened by DNA dot blot differential hybridization using the oligonucleotide probe, Oligo #149, which had been labeled with P^{32} . Clones shown to be positive by colony hybridization were selected, plasmid DNA isolated and DNA

sequenced to determine the amino acid substitution.

EXAMPLE 49

5 Construction of single amino acid substitution libraries at positions 83, 84, 85, 86, 87 and 88

One of the DNA fragments used to construct the plasmids containing single amino acid substitutions at positions 10 83, 84, 85, 86, 87 and 88 of hIL-3 was generated by site-directed mutagenesis employing PCR techniques described previously. In the PCR reaction the plasmid pMON6475 DNA was the template and the following 32 fold degenerate oligonucleotides, Oligo #109, Oligo #110, Oligo #111, 15 Oligo #112, Oligo #113 and Oligo #114 , were the primers at the N-terminus. The oligonucleotide, Oligo #26, was used as the primer at the C-terminus. The degenerate oligonucleotides replace the eighteen bases, encoding six amino acids, deleted in pMON6475. The degenerate 20 oligonucleotides have G, A, T or C in the first and second positions and G or C in the third position of a single codon at amino acid positions 83, 84, 85, 86, 87 and 88 of hIL-3 respectively. These degenerate oligonucleotide primers result in libraries which 25 theoretically contain 32 different codons encoding all 20 amino acid substitutions and one translational stop codon at one position. At the other five amino acid positions the native hIL-3 DNA sequence was restored. The resulting PCR-generated DNA products were purified and 30 digested with the restriction enzymes *EcoRI* and *PstI*. Plasmid pMON6475 DNA was digested with restriction enzymes *EcoRI* and *PstI* and the resulting 4171 base pair fragment was ligated to the PCR-generated *EcoRI*, *PstI* DNA fragments. Transformant bacteria were screened by DNA 35 dot blot differential hybridization using the oligonucleotide probe, Oligo #150, which had been labeled with P^{32} . Clones shown to be positive by colony hybridization were selected, plasmid DNA isolated and DNA

sequenced to determine the amino acid substitution.

EXAMPLE 50

5 Construction of single amino acid substitution libraries at positions 88, 89, 90, 91, 92 and 93

One of the DNA fragments used to construct the plasmids containing single amino acid substitutions at positions 10 88, 89, 90, 91, 92 and 93 of hIL-3 was generated by site-directed mutagenesis employing PCR techniques described previously. In the PCR reaction the plasmid pMON6476 DNA was the template and the following degenerate oligonucleotides, Oligo #114, Oligo #115, Oligo #116, 15 Oligo #117, Oligo #118 and Oligo #119 , were the primers at the C-terminus. The oligonucleotide, Oligo #7, was used as the primer at the N-terminus. The degenerate oligonucleotides replace the eighteen bases, encoding six amino acids, deleted in pMON6476. The degenerate 20 oligonucleotides have G, A, T or C in the first and second positions and G or C in the third position of a single codon at amino acid positions 88, 89, 90, 91, 92 and 93 of hIL-3 respectively. These degenerate oligonucleotide primers result in libraries which 25 theoretically contain 32 different codons encoding all 20 amino acid substitutions and one translational stop codon at one position. At the other five amino acid positions the native hIL-3 DNA sequence was restored. The resulting PCR-generated DNA products were purified and 30 digested with the restriction enzymes EcoRI and NcoI. Plasmid pMON6476 DNA was digested with restriction enzymes EcoRI and NcoI and the resulting 4008 base pair fragment was ligated to the PCR-generated EcoRI, NcoI DNA fragments. Transformant bacteria were screened by DNA 35 dot blot differential hybridization using the oligonucleotide probe, Oligo #151, which had been labeled with P32. Clones shown to be positive by colony hybridization were selected, plasmid DNA isolated and DNA

sequenced to determine the amino acid substitution.

EXAMPLE 51

5 Construction of single amino acid substitution libraries at positions 106, 107, 108, 109, 110 and 111

One of the DNA fragments used to construct the plasmids containing the single amino acid substitutions at 10 positions 106, 107, 108, 109, 110 and 111 of hIL-3 was generated by site-directed mutagenesis employing PCR techniques described previously in two sequential PCR reactions. In the first PCR reaction, plasmid pMON6477 DNA was the template and the following 32 fold degenerate 15 oligonucleotides, Oligo #120, Oligo #121, Oligo #122, Oligo #123, Oligo #124 and Oligo #125 were the primers at the C-terminus. The oligonucleotide, Oligo #7 was the primer at the N-terminus. The degenerate oligonucleotides replace the eighteen bases, encoding six 20 amino acids, deleted in pMON6477. The degenerate oligonucleotides have G, A, T or C in the first and second positions and G or C in the third position of a single codon at amino acid positions 106, 107, 108, 109, 110 and 111 of hIL-3 respectively. These degenerate 25 oligonucleotide primers result in libraries which theoretically contain 32 different codons encoding all 20 amino acid substitutions and one translational stop codon at one position. At the other five amino acid positions the native hIL-3 DNA sequence was restored. The DNA 30 generated in this PCR reaction was purified by phenol/chloroform extraction and precipitation with equal volume isopropanol in the presence of 2M NH₄OAc to remove any primer that was not extended. This DNA was then used as a primer in the second PCR reaction.

35 In the second PCR reaction plasmid pMON6477 DNA was the template, the DNA product generated in the first PCR reaction (described above) was the primer at the N-terminus and the oligonucleotide, Oligo #126 (DNA

sequence shown in Table 1), was the primer at the C-terminus. The resulting PCR-generated DNA products were purified and digested with the restriction enzymes *HindIII* and *NcoI*. Plasmid pMON6477 was digested with 5 restriction enzymes *HindIII* and *NcoI* and the resulting 3944 base pair fragment was ligated to the PCR-generated *HindIII*, *NcoI* DNA fragments. Transformant bacteria were screened by DNA dot blot differential hybridization using the oligonucleotide probe, Oligo #152, which had been 10 labeled with P³². Clones shown to be positive by colony hybridization were selected, plasmid DNA isolated and DNA sequenced to determine the amino acid substitution.

EXAMPLE 52

15

Construction of single amino acid substitution libraries at positions 112, 113, 114, 115, 116 and 117

One of the DNA fragments used to construct the plasmids 20 containing single amino acid substitutions at positions 112, 113, 114, 115, 116 and 117 of hIL-3 was generated by site-directed mutagenesis employing PCR techniques described previously. In the PCR reaction the plasmid pMON6478 DNA was the template and the following 32 fold 25 degenerate oligonucleotides, Oligo #127, Oligo #128, Oligo #129, Oligo #130, Oligo #131 and Oligo #132 , were the primers at the C-terminus. The oligonucleotide, Oligo #7, was used as the primer at the N-terminus. The degenerate oligonucleotides replace the eighteen bases, 30 encoding six amino acids, deleted in pMON6478. The degenerate oligonucleotides have G, A, T or C in the first and second positions and G or C in the third position of a single codon at amino acid positions 112, 113, 114, 115, 116 and 117 of hIL-3 respectively. These 35 degenerate oligonucleotide primers result in libraries which theoretically contain 32 different codons encoding all 20 amino acid substitutions and one translational stop codon at one position. At the other five amino acid

positions the native hIL-3 DNA sequence was restored. The resulting PCR-generated DNA products were purified and digested with the restriction enzymes *HindIII* and *NcoI*. Plasmid pMON6478 was digested with restriction 5 enzymes *HindIII* and *NcoI* and the resulting 3944 base pair fragment was ligated to the PCR-generated *HindIII*, *NcoI* DNA fragments. Transformant bacteria were screened by DNA dot blot differential hybridization using the oligonucleotide probe, Oligo #153, which had been labeled 10 with P32. Clones shown to be positive by colony hybridization were selected, plasmid DNA isolated and DNA sequenced to determine the amino acid substitution.

EXAMPLE 53

15 Construction of single amino acid substitution libraries at positions 118, 119, 120, 121, 122 and 123

One of the DNA fragments used to construct the plasmids 20 containing single amino acid substitutions at positions 118, 119, 120, 121, 122 and 123 of hIL-3 was generated by site-directed mutagenesis employing PCR techniques described previously. In the PCR reaction the plasmid pMON6479 DNA was the template and the following 32 fold 25 degenerate oligonucleotides, Oligo #133, Oligo #134, Oligo #135, Oligo #136, Oligo #137 and Oligo #138 , were the primers at the C-terminus. The oligonucleotide, Oligo #7, was used as the primer at the N-terminus. The degenerate oligonucleotides replace the eighteen bases, 30 encoding six amino acids, deleted in pMON6479. The degenerate oligonucleotides have G, A, T or C in the first and second positions and G or C in the third position of a single codon at amino acid positions 118, 119, 120, 121, 122 and 123 of hIL-3 respectively. These 35 degenerate oligonucleotide primers result in libraries which theoretically contain 32 different codons encoding all 20 amino acid substitutions and one translational stop codon at one position. At the other five amino acid

positions the native hIL-3 DNA sequence was restored. The resulting PCR-generated DNA products were purified and digested with the restriction enzymes *HindIII* and *NcoI*. Plasmid pMON6479 DNA was digested with restriction enzymes *HindIII* and *NcoI* and the resulting 3944 base pair fragment was ligated to the PCR-generated *HindIII*, *NcoI* DNA fragments. Transformant bacteria were screened by DNA dot blot differential hybridization using the oligonucleotide probe, Oligo #154, which had been labeled with P^{32} . Clones shown to be positive by colony hybridization were selected, plasmid DNA isolated and DNA sequenced to determine the amino acid substitution.

EXAMPLE 54

15

Construction of pMON13358

Plasmid pMON5978 DNA (Example 6) was digested with restriction enzymes *NsiI* and *EcoRI* and the resulting 3853 base pair *NsiI*,*EcoRI* fragment contains the following genetic elements; beta-lactamase gene (AMP), pBR327 origin of replication, phage f1 origin of replication as the transcription terminator, recA promoter, g10L ribosome binding site and the bases encoding amino acids 15-71 and 106-125 of (15-125) hIL-3. The 3853 base pair *NsiI*,*EcoRI* restriction fragment from pMON5978 was ligated to the following annealed complementary oligonucleotides.

Oligo #15(A) [SEQ ID NO: 29]

30

Oligo #16(A) [SEQ ID NO: 30]

In the resulting plasmid the 111 bases between the *NsiI* and *EcoRI* restriction sites in the (15-125) hIL-3 gene 35 are replaced with 24 bases from the above mentioned oligonucleotides. This linker also creates a *NdeI* recognition sequence.

EXAMPLE 55Construction of pMON13304

5 Plasmid pMON13358 DNA is digested with restriction enzymes PstI and EcoRI and the resulting 3846 base pair PstI,EcoRI fragment contains the following genetic elements; beta-lactamase gene (AMP), pBR327 origin of replication, phage f1 origin of replication as the
10 transcription terminator, recA promoter, g10L ribosome binding site and the bases encoding amino acids 15-69 and 106-125 of (15-125) hIL-3. The 3846 base pair NsiI,EcoRI restriction fragment from pMON13358 is ligated to the following annealed complementary oligonucleotides.

EXAMPLE 58

20

Construction of pMON5853 (Fig 6) which encodes [Met-(15-133)hIL-3(Arg¹²⁹)]

Plasmid DNA of pMON5847 (Example 2) was treated with
25 NcoI. The restriction enzyme was inactivated by heat
treatment (65°C for 10 minutes). The DNA was then
treated with large fragment of DNA polymerase I (Klenow)
in the presence of all four nucleotide precursors. This
produces DNA termini with non-overlapping ends. After 5
30 minutes at 37°C, the polymerase was inactivated by heat
treatment at 65°C for 10 minutes. The DNA was then
treated with HpaI, an enzyme which produces non-
overlapping termini. The DNA was ethanol precipitated
and ligated. The ligation reaction mixture was used to
35 transform competent JM101 cells to ampicillin resistance.
Colonies were picked and plasmid DNA was analyzed by
restriction analysis. A plasmid designated pMON5853 was
identified as one containing a deletion of the amino
terminal 14 codons of the hIL-3 gene. The DNA sequence
40 for the junction of the ribosome binding site to the
(15-133) hIL-3 gene was determined to be the following:

5'-AAGGAGATATCCATGAAC TGCTCTAAC-3' [SEQ ID NO:133]

M N C S N [SEQ ID NO:134]

The lower line contains the one-letter code for the
5 amino acids specified by the coding sequence of the amino
terminus of the 15-133 hIL-3 gene. These are methionine,
asparagine, cysteine, serine and asparagine.

When cultures of JM101 cells harboring this plasmid
10 were induced with nalidixic acid, it was found that hIL-3
(15-133) accumulated at levels higher than hIL-3
(pMON5847).

15 The plasmid, pMON5853, encodes Met-(15-133) hIL-3
(Arg¹²⁹) which has the following amino acid sequence:

Met Asn Cys Ser Asn Met Ile Asp Glu Ile Ile Thr
His Leu Lys Gln Pro Pro Leu Pro Leu Leu Asp Phe Asn
Asn Leu Asn Gly Glu Asp Gln Asp Ile Leu Met Glu Asn
20 Asn Leu Arg Arg Pro Asn Leu Glu Ala Phe Asn Arg Ala
Val Lys Ser Leu Gln Asn Ala Ser Ala Ile Glu Ser Ile

Ala Pro Thr Arg His Pro Ile His Ile Lys Asp Gly Asp
Trp Asn Glu Phe Arg Arg Lys Leu Thr Phe Tyr Leu Lys
25 Thr Leu Glu Asn Ala Gln Ala Gln Thr Thr Leu Arg
Leu Ala Ile Phe [SEQ ID NO:135]

Formula XI shown below is a representation of a
[(15-125)hIL-3 mutein] with numbers in bold type added
30 above the amino acids to represent the position at which
the amino acid below the bolded number appears in native
(1-133)hIL-3 [e. g. the amino acid at position 1 of
Formula XI corresponds to the Asn which appears at
position 15 in native (1-133)hIL-3]. The number shown in
35 bold indicates the amino acids that correspond to the
native IL-3(1-133). The non-bold members below the amino
acids sequences are for Seq Id reference numbers. When
the muteins are expressed the initial amino acid may be

preceded by Met- or Met-Ala-.

Table 6 shows (15-125)hIL-3 muteins of the present invention which have one (and in some cases two) amino acid substitutions in the (15-125)hIL-3 polypeptide and which were constructed as described in the Examples. The mutants in Table 6 were secreted into the periplasmic space in E.coli. The periplasmic content was released by osmotic shock and the material in the crude osmotic shock fraction was screened for growth promoting activity. Biological activity is the growth promoting activity of AML cells relative to (15-125) hIL-3 (pMON6458 or pMMON5988). The numbers in parentheses indicate the number of repeat assays. When a variant was assayed more than once the standard deviation is indicated. An "-" indicates that the hIL3 variant protein level was less than 1.0 µg/ml and was not screened for growth promoting activity.

The mutants in Table 6 were made as described in the Examples, particularly Examples 19, 20, 21 and 38 to 53.

It will be apparent to those skilled in the art that other codons besides those shown in Table 6 can also code for the substituted amino acids in the hIL-3 muteins. The present invention includes the DNAs encoding the mutant hIL-3 polypeptides of the invention including the various codons which can code for the parental and substituted amino acids of the hIL-3 muteins of the invention due to the degeneracy of the genetic code.

hIL-3 (15-125) variant genes encoding the variants listed in Table 6 can also be expressed from intracellular expression vectors to produce large quantities of the variant protein which can be purified and assayed for biological activity. The hIL-3 variant genes, from Table 6, can be excised from the secretion expression vector, as a 345 base pair NcoI/HindIII fragment and ligated into an appropriate intracellular expression vector, such as pMON2341 digested with NcoI and HindIII. Examples of variants transferred to pMON2341 in this manner are shown in Table 7. Two examples of such a transfer are described in the construction of pMON13215 (EXAMPLE 64) and pMON13252 (EXAMPLE 65).

EXAMPLE 64Construction of pMON13215

5 Plasmid, pMON2341, DNA was digested with restriction enzymes NcoI and HindIII resulting in a 3619 base pair NcoI/HindIII fragment. The genetic elements derived from pMON2341 are the beta-lactamase gene (AMP), pBR327 origin of replication, F1 phage origin of replication as the transcription terminator, *precA*, g10L ribosome binding site. The plasmid encoding the hIL-3 (15-125) Trp⁽¹¹⁶⁾ variant, from Table 6 was digested with NcoI and HindIII resulting in a 345 base pair NcoI/HindIII fragment. The 345 Base pair NcoI/HindIII fragment was ligated with the 15 3619 base pair fragment from pMON2341 and the ligation reaction mixture was used to transform *E.coli* K-12 strain JM101. Plasmid DNA was isolated and screened by restriction analysis using NcoI and HindIII. Positive clones contained a 345 base pair NcoI/HindIII. This 20 construct was designated PMON13215. The plasmid, pMON13215, encodes the (15-125)hIL-3 variant with the following amino acid sequence:

PEPTIDE A9; (15-125)HIL-3 TRP⁽¹¹⁶⁾ PMON13215

EXAMPLE 65

Construction of pMON13252

20

Plasmid, pMON2341, DNA was digested with restriction enzymes NcoI and HindIII resulting in a 3619 base pair NcoI/HindIII fragment. The genetic elements derived from pMON2341 are the beta-lactamase gene (AMP), pBR327 origin of replication F1 phage origin of replication as the transcription terminator, precA, g10L ribosome binding site. The plasmid encoding the hIL-3 (15-125) Asp⁽⁵⁰⁾ variant, from Table 6, was digested with NcoI and HindIII resulting in a 345 base pair NcoI/HindIII fragment. This 345 Base pair NcoI/HindIII fragment was ligated with the 3619 base pair fragment from pMON2341 and the ligation reaction mixture was used to transform E.coli K-12 strain JM101. Plasmid DNA was isolated and screened by restriction analysis using NcoI and HindIII. Positive clones contained a 345 base pair NcoI/HindIII. This construct was designated pMON13252. The plasmid, pMON13252, encodes the (15-125)hIL-3 variant with the following amino acid sequence:

PEPTIDE A10; (15-125)HIL-3 ASP⁽⁵⁰⁾ pMON13252

Table 7 shows the biological activity of (15-125)hIL-3 mutant polypeptides of the present invention expressed from intracellular expression vectors. Upon expression these muteins may have Met- or Met-Ala- preceding the initial (15-125)hIL-3 amino acid. The relative biological activity of IL-3 mutants is calculated by dividing the EC₅₀ (1-133) hIL-3 by the EC₅₀ of the mutant.

10

Example 66

The variants in Table 8 were constructed by cassette mutagenesis using methods described in the Materials and Methods and the Examples contained herein, particularly Examples 54-57. Parental plasmid DNA (Table 8), digested with the appropriate restriction enzymes (Table 8), was ligated with the indicated annealed pairs of complementary oligonucleotides (Table 8). The assembled oligonucleotides create appropriate restriction ends and a portion of the (15-125) hIL-3 gene sequence. Individual isolates were screened by restriction analysis and DNA sequenced to confirm that the desired changes in the (15-125) hIL-3 variant gene were made. The oligonucleotides create change(s) in the (15-125) hIL-3 gene which encode the corresponding amino acid substitution in the variant polypeptide (Table 8). The amino acids substitutions in polypeptide #1 (SEQ ID NO:65) are indicated in Table 8.

It will be apparent to those skilled in the art that other codons besides those shown in Table 8 can also code for the substituted amino acids in the hIL-3 muteins. The present invention includes the DNAs encoding the 5 mutant hIL-3 polypeptides of the invention including the various codons which can code for the parental and substituted amino acids of the hIL-3 muteins of the invention due to the degeneracy of the genetic code.

hIL-3 (15-125) variant genes encoding the 10 variants listed in Table 8 can also be expressed from intracellular expression vectors to produce large quantities of the variant protein which can be purified and assayed for biological activity. The hIL-3 variant genes, from Table 8, can be excised from the secretion 15 expression vector, as a 345 base pair NcoI/HindIII fragment and ligated into an appropriate intracellular expression vector, such as pMON2341 digested with NcoI and HindIII.

20 Table 9 shows the biological activity of (15-125)hIL-3 muteins of the present invention which have one amino acid substitutions in the (15-125)hIL-3 polypeptide and which were constructed as described in Example 66. The mutants in Table 9 were secreted into the periplasmic 25 space in E.coli. The periplasmic content was released by osmotic shock and the material in the crude osmotic shock fraction was screened for growth promoting activity. Biological activity is the growth promoting activity of AML cells relative to (15-125) hIL-3 (pMON6458 or 30 pMMON5988). The relative biological activity of IL-3 mutants is calculated by dividing the EC50 (1-133) hIL-3 by the EC50 of the mutant. The numbers in parentheses indicate the number of repeat assays. When a variant was assayed more than once the standard deviation is 35 indicated. An "*" indicates that the hIL3 variant protein level was less than 1.0 ug/ml and was not screened for growth promoting activity.

wherein;

Xaa at position 17 is Ser, Lys, Gly, Asp, Met, Gln, or
35 Arg;
Xaa at position 18 is Asn, His, Leu, Ile, Phe, Arg, or Gln;
Xaa at position 19 is Met, Phe, Ile, Arg, Gly, Ala, or Cys;
Xaa at position 20 is Ile, Cys, Gln, Glu, Arg, Pro, or Ala;

- Xaa at position 21 is Asp, Phe, Lys, Arg, Ala, Gly, Glu, Gln, Asn,
Thr, Ser or Val;
- Xaa at position 22 is Glu, Trp, Pro, Ser, Ala, His, Asp, Asn, Gln,
Leu, Val or Gly;
- 5 Xaa at position 23 is Ile, Val, Ala, Leu, Gly, Trp, Lys, Phe,
Leu, Ser, or Arg;
- Xaa at position 24 is Ile, Gly, Val, Arg, Ser, Phe, or Leu;
- Xaa at position 25 is Thr, His, Gly, Gln, Arg, Pro, or Ala;
- Xaa at position 26 is His, Thr, Phe, Gly, Arg, Ala, or Trp;
- 10 Xaa at position 27 is Leu, Gly, Arg, Thr, Ser, or Ala;
- Xaa at position 28 is Lys, Arg, Leu, Gln, Gly, Pro, Val or Trp;
- Xaa at position 29 is Gln, Asn, Leu, Pro, Arg, or Val;
- Xaa at position 30 is Pro, His, Thr, Gly, Asp, Gln, Ser, Leu, or
Lys;
- 15 Xaa at position 31 is Pro, Asp, Gly, Ala, Arg, Leu, or Gln;
- Xaa at position 32 is Leu, Val, Arg, Gln, Asn, Gly, Ala, or Glu;
- Xaa at position 33 is Pro, Leu, Gln, Ala, Thr, or Glu;
- Xaa at position 34 is Leu, Val, Gly, Ser, Lys, Glu, Gln, Thr, Arg,
Ala, Phe, Ile or Met;
- 20 Xaa at position 35 is Leu, Ala, Gly, Asn, Pro, Gln, or Val;
- Xaa at position 36 is Asp, Leu, or Val;
- Xaa at position 37 is Phe, Ser, Pro, Trp, or Ile;
- Xaa at position 38 is Asn, or Ala;
- Xaa at position 40 is Leu, Trp, or Arg;
- 25 Xaa at position 41 is Asn, Cys, Arg, Leu, His, Met, or Pro;
- Xaa at position 42 is Gly, Asp, Ser, Cys, Asn, Lys, Thr, Leu, Val,
Glu, Phe, Tyr, Ile, Met or Ala;
- Xaa at position 43 is Glu, Asn, Tyr, Leu, Phe, Asp, Ala, Cys, Gln,
Arg, Thr, Gly or Ser;
- 30 Xaa at position 44 is Asp, Ser, Leu, Arg, Lys, Thr, Met, Trp, Glu,
Asn, Gln, Ala or Pro;
- Xaa at position 45 is Gln, Pro, Phe, Val, Met, Leu, Thr, Lys, Trp,
Asp, Asn, Arg, Ser, Ala, Ile, Glu or His;
- Xaa at position 46 is Asp, Phe, Ser, Thr, Cys, Glu, Asn, Gln, Lys,
- 35 His, Ala, Tyr, Ile, Val or Gly;
- Xaa at position 47 is Ile, Gly, Val, Ser, Arg, Pro, or His;
- Xaa at position 48 is Leu, Ser, Cys, Arg, Ile, His, Phe, Glu, Lys,
Thr, Ala, Met, Val or Asn;

Xaa at position 49 is Met, Arg, Ala, Gly, Pro, Asn, His, or Asp;
Xaa at position 50 is Glu, Leu, Thr, Asp, Tyr, Lys, Asn, Ser, Ala,
Ile, Val, His, Phe, Met or Gln;

Xaa at position 51 is Asn, Arg, Met, Pro, Ser, Thr, or His;

5 Xaa at position 52 is Asn, His, Arg, Leu, Gly, Ser, or Thr;

Xaa at position 53 is Leu, Thr, Ala, Gly, Glu, Pro, Lys, Ser, or
Met;

Xaa at position 54 is Arg, Asp, Ile, Ser, Val, Thr, Gln, Asn, Lys,
His, Ala or Leu;

10 Xaa at position 55 is Arg, Thr, Val, Ser, Leu, or Gly;

Xaa at position 56 is Pro, Gly, Cys, Ser, Gln, Glu, Arg, His,
Thr, Ala, Tyr, Phe, Leu, Val or Lys;

Xaa at position 57 is Asn or Gly;

Xaa at position 58 is Leu, Ser, Asp, Arg, Gln, Val, or Cys;

15 Xaa at position 59 is Glu, Tyr, His, Leu, Pro, or Arg;

Xaa at position 60 is Ala, Ser, Pro, Tyr, Asn, or Thr;

Xaa at position 61 is Phe, Asn, Glu, Pro, Lys, Arg, or Ser;

Xaa at position 62 is Asn, His, Val, Arg, Pro, Thr, Asp, or Ile;

Xaa at position 63 is Arg, Tyr, Trp, Lys, Ser, His, Pro, or Val;

20 Xaa at position 64 is Ala, Asn, Pro, Ser, or Lys;

Xaa at position 65 is Val, Thr, Pro, His, Leu, Phe, or Ser;

Xaa at position 66 is Lys, Ile, Arg, Val, Asn, Glu, or Ser;

Xaa at position 67 is Ser, Ala, Phe, Val, Gly, Asn, Ile, Pro, or
His;

25 Xaa at position 68 is Leu, Val, Trp, Ser, Ile, Phe, Thr, or His;

Xaa at position 69 is Gln, Ala, Pro, Thr, Glu, Arg, Trp, Gly, or
Leu;

Xaa at position 70 is Asn, Leu, Val, Trp, Pro, or Ala;

Xaa at position 71 is Ala, Met, Leu, Pro, Arg, Glu, Thr, Gln,

30 Trp, or Asn;

Xaa at position 72 is Ser, Glu, Met, Ala, His, Asn, Arg, or Asp;

Xaa at position 73 is Ala, Glu, Asp, Leu, Ser, Gly, Thr, or Arg;

Xaa at position 74 is Ile, Met, Thr, Pro, Arg, Gly, Ala;

Xaa at position 75 is Glu, Lys, Gly, Asp, Pro, Trp, Arg, Ser,

35 Gln, or Leu;

Xaa at position 76 is Ser, Val, Ala, Asn, Trp, Glu, Pro, Gly, or
Asp;

Xaa at position 77 is Ile, Ser, Arg, Thr, or Leu;

- Xaa at position 78 is Leu, Ala, Ser, Glu, Phe, Gly, or Arg;
Xaa at position 79 is Lys, Thr, Asn, Met, Arg, Ile, Gly, or
Asp;
- Xaa at position 80 is Asn, Trp, Val, Gly, Thr, Leu, Glu, or Arg;
- 5 Xaa at position 81 is Leu, Gln, Gly, Ala, Trp, Arg, Val, or Lys;
Xaa at position 82 is Leu, Gln, Lys, Trp, Arg, Asp, Glu, Asn, His,
Thr, Ser, Ala, Tyr, Phe, Ile, Met or Val;
- Xaa at position 83 is Pro, Ala, Thr, Trp, Arg, or Met;
- Xaa at position 84 is Cys, Glu, Gly, Arg, Met, or Val;
- 10 Xaa at position 85 is Leu, Asn, Val, or Gln;
Xaa at position 86 is Pro, Cys, Arg, Ala, or Lys;
- Xaa at position 87 is Leu, Ser, Trp, or Gly;
- Xaa at position 88 is Ala, Lys, Arg, Val, or Trp;
- Xaa at position 89 is Thr, Asp, Cys, Leu, Val, Glu, His, Asn, or
15 Ser;
- Xaa at position 90 is Ala, Pro, Ser, Thr, Gly, Asp, Ile, or Met;
- Xaa at position 91 is Ala, Pro, Ser, Thr, Phe, Leu, Asp, or His;
- Xaa at position 92 is Pro, Phe, Arg, Ser, Lys, His, Ala, Gly, Ile
or Leu;
- 20 Xaa at position 93 is Thr, Asp, Ser, Asn, Pro, Ala, Leu, or Arg;
Xaa at position 94 is Arg, Ile, Ser, Glu, Leu, Val, Gln, Lys, His,
Ala, or Pro;
- Xaa at position 95 is His, Gln, Pro, Arg, Val, Leu, Gly, Thr, Asn,
Lys, Ser, Ala, Trp, Phe, Ile, or Tyr;
- 25 Xaa at position 96 is Pro, Lys, Tyr, Gly, Ile, or Thr;
Xaa at position 97 is Ile, Val, Lys, Ala, or Asn;
- Xaa at position 98 is His, Ile, Asn, Leu, Asp, Ala, Thr,
Glu, Gln, Ser, Phe, Met, Val, Lys, Arg, Tyr or Pro;
- Xaa at position 99 is Ile, Leu, Arg, Asp, Val, Pro, Gln,
30 Gly, Ser, Phe, or His;
- Xaa at position 100 is Lys, Tyr, Leu, His, Arg, Ile, Ser, Gln,
or Pro;
- Xaa at position 101 is Asp, Pro, Met, Lys, His, Thr, Val,
Tyr, Glu, Asn, Ser, Ala, Gly, Ile, Leu, or Gln;
- 35 Xaa at position 102 is Gly, Leu, Glu, Lys, Ser, Tyr, or Pro;
Xaa at position 103 is Asp, or Ser;
- Xaa at position 104 is Trp, Val, Cys, Tyr, Thr, Met, Pro, Leu,
Gln, Lys, Ala, Phe, or Gly;

Xaa at position 105 is Asn, Pro, Ala, Phe, Ser, Trp, Gln, Tyr,
Leu, Lys, Ile, Asp, or His;

Xaa at position 106 is Glu, Ser, Ala, Lys, Thr, Ile, Gly, or Pro;

Xaa at position 108 is Arg, Lys, Asp, Leu, Thr, Ile, Gln, His, Ser,

5 Ala or Pro;

Xaa at position 109 is Arg, Thr, Pro, Glu, Tyr, Leu, Ser, or Gly;

Xaa at position 110 is Lys, Ala, Asn, Thr, Leu, Arg, Gln, His, Glu,
Ser, Ala, or Trp;

Xaa at position 111 is Leu, Ile, Arg, Asp, or Met;

10 Xaa at position 112 is Thr, Val, Gln, Tyr, Glu, His, Ser, or Phe;

Xaa at position 113 is Phe, Ser, Cys, His, Gly, Trp, Tyr, Asp,
Lys, Leu, Ile, Val or Asn;

Xaa at position 114 is Tyr, Cys, His, Ser, Trp, Arg, or Leu;

Xaa at position 115 is Leu, Asn, Val, Pro, Arg, Ala, His, Thr,

15 Trp, or Met;

Xaa at position 116 is Lys, Leu, Pro, Thr, Met, Asp, Val, Glu,
Arg, Trp, Ser, Asn, His, Ala, Tyr, Phe, Gln, or Ile;

Xaa at position 117 is Thr, Ser, Asn, Ile, Trp, Lys, or Pro;

Xaa at position 118 is Leu, Ser, Pro, Ala, Glu, Cys, Asp, or Tyr;

20 Xaa at position 119 is Glu, Ser, Lys, Pro, Leu, Thr, Tyr, or Arg;

Xaa at position 120 is Asn, Ala, Pro, Leu, His, Val, or Gln;

Xaa at position 121 is Ala, Ser, Ile, Asn, Pro, Lys, Asp, or
Gly;

Xaa at position 122 is Gln, Ser, Met, Trp, Arg, Phe, Pro, His,

25 Ile, Tyr, or Cys;

Xaa at position 123 is Ala, Met, Glu, His, Ser, Pro, Tyr, or Leu;

and which can additionally have Met- preceding the amino acid in
position 1; and wherein from 1 to 14 amino acids can be deleted

30 from the N-terminus and/or from 1 to 15 amino acids can be deleted
from the C-terminus; and wherein from one to three of the amino
acids designated by Xaa are different from the corresponding amino
acids of native (1-133) human interleukin-3 with the proviso that
when Xaa at position 22 is Leu, and/or Xaa at position 34 is Gly or

35 Glu, and/or Xaa at position 44 is Ala, and/or Xaa at position 46 is
Lys or Ala, and/or Xaa at position 50 is Lys, and/or Xaa at
position 59 is Pro or Arg, and/or Xaa at position 63 is Lys, and/or
Xaa at position 75 is Gly or Arg, and/or Xaa at position 94 is Pro,

and/or Xaa at position 98 is Arg, and/or Xaa at position 106 is Lys, and/or Xaa at position 110 is Ala or Glu, and/or Xaa at position 111 is Met, then there must be at least one additional substitution besides the ones indicated.

5

wherein

Xaa at position 17 is Ser, Gly, Asp, Met, or Gln;

Xaa at position 18 is Asn, His, Leu, Ile, Phe, Arg, or Gln;
Xaa at position 19 is Met, Phe, Ile, Arg, or Ala;
Xaa at position 20 is Ile or Pro;
Xaa at position 21 is Asp or Glu;

5 Xaa at position 23 is Ile, Val, Ala, Leu, or Gly;
Xaa at position 24 is Ile, Val, Phe, or Leu;
Xaa at position 25 is Thr, His, Gly, Gln, Arg, Pro, or Ala;
Xaa at position 26 is His, Phe, Gly, Arg, or Ala;
Xaa at position 28 is Lys, Leu, Gln, Gly, Pro, or Val;

10 Xaa at position 29 is Gln, Asn, Leu, Arg, or Val;
Xaa at position 30 is Pro, His, Thr, Gly, or Gln;
Xaa at position 31 is Pro, Asp, Gly, Ala, Arg, Leu, or Gln;
Xaa at position 32 is Leu, Arg, Gln, Asn, Gly, Ala, or Glu;
Xaa at position 33 is Pro, Leu, Gln, Ala, or Glu;

15 Xaa at position 34 is Leu, Val, Gly, Ser, Lys, Ala, Arg, Gln, Glu,
Ile, Phe, Thr or Met;
Xaa at position 35 is Leu, Ala, Asn, Pro, Gln, or Val;
Xaa at position 36 is Asp or Leu;
Xaa at position 37 is Phe, Ser, Pro, Trp, or Ile;

20 Xaa at position 38 is Asn or Ala;
Xaa at position 41 is Asn, Cys, Arg, His, Met, or Pro;
Xaa at position 42 is Gly, Asp, Ser, Cys, Ala, Asn, Ile, Leu, Met,
Tyr, Val or Arg;

Xaa at position 44 is Asp or Glu;

25 Xaa at position 45 is Gln, Val, Met, Leu, Thr, Lys, Ala, Asn, Glu,
Ser, or Trp;
Xaa at position 46 is Asp, Phe, Ser, Thr, Cys, Ala, Asn, Gln, Glu,
His, Ile, Lys, Tyr, Val or Gly;

Xaa at position 47 is Ile, Val, or His;

30 Xaa at position 49 is Met, Asn, or Asp;
Xaa at position 50 is Glu, Thr, Ala, Asn, Ser or Asp;
Xaa at position 51 is Asn, Arg, Met, Pro, Ser, Thr, or His;
Xaa at position 52 is Asn or Gly;

Xaa at position 53 is Leu, Met, or Phe;

35 Xaa at position 54 is Arg, Ala, or Ser;
Xaa at position 55 is Arg, Thr, Val, Leu, or Gly;
Xaa at position 56 is Pro, Gly, Cys, Ser, Gln, Ala, Arg, Asn, Glu,
His, Leu, Thr, Val or Lys;

Xaa at position 59 is Glu, Tyr, His, Leu, or Arg;
Xaa at position 60 is Ala, Ser, Asn, or Thr;
Xaa at position 61 is Phe or Ser;
Xaa at position 62 is Asn, Val, Pro, Thr, or Ile;
5 Xaa at position 63 is Arg, Tyr, Lys, Ser, His, or Val;
Xaa at position 64 is Ala or Asn;
Xaa at position 65 is Val, Thr, Leu, or Ser;
Xaa at position 66 is Lys, Ile, Arg, Val, Asn, Glu, or Ser;
Xaa at position 67 is Ser, Phe, Val, Gly, Asn, Ile, or His;
10 Xaa at position 68 is Leu, Val, Ile, Phe, or His;
Xaa at position 69 is Gln, Ala, Pro, Thr, Glu, Arg, or Gly;
Xaa at position 70 is Asn or Pro;
Xaa at position 71 is Ala, Met, Pro, Arg, Glu, Thr, or Gln;
Xaa at position 72 is Ser, Glu, Met, Ala, His, Asn, Arg, or Asp;
15 Xaa at position 73 is Ala, Glu, Asp, Leu, Ser, Gly, Thr, Arg, or
Pro;
Xaa at position 74 is Ile or Met;
Xaa at position 75 is Glu, Gly, Asp, Ser, or Gln;
Xaa at position 76 is Ser, Val, Ala, Asn, Glu, Pro, Gly, or
20 Asp;
Xaa at position 77 is Ile, Ser, or Leu;
Xaa at position 79 is Lys, Thr, Gly, Asn, Met, Arg, Ile, Gly, or
Asp;
Xaa at position 80 is Asn, Val, Gly, Thr, Leu, Glu, or Arg;
25 Xaa at position 81 is Leu, or Val;
Xaa at position 82 is Leu, Gln, Trp, Arg, Asp, Ala, Asn, Glu, His,
Met, Phe, Ser, Thr, Tyr or Val;
Xaa at position 83 is Pro, Ala, Thr, Trp, or Met;
Xaa at position 85 is Leu or Val;
30 Xaa at position 87 is Leu or Ser;
Xaa at position 88 is Ala, Arg, or Trp;
Xaa at position 89 is Thr, Asp, Glu, His, Asn, or Ser;
Xaa at position 90 is Ala, Asp, or Met;
Xaa at position 91 is Ala, Pro, Ser, Thr, Phe, Leu, or Asp;
35 Xaa at position 92 is Pro or Ser;
Xaa at position 93 is Thr, Asp, Ser, Pro, Ala, Leu, or Arg;
Xaa at position 95 is His, Pro, Arg, Val, Leu, Gly, Asn, Ile, Phe,
Ser or Thr;

Xaa at position 96 is Pro or Tyr;
Xaa at position 97 is Ile, Val, or Ala;
Xaa at position 98 is His, Ile, Asn, Leu, Asp, Ala, Thr, Leu, Arg,
Gln, Glu, lys, Met, Ser, Tyr, Val or Pro;

5 Xaa at position 99 is Ile, Leu, Val, or Phe;
Xaa at position 100 is Lys, Leu, His, Arg, Ile, Gln, Pro, or
Ser;
Xaa at position 101 is Asp, Pro, Met, Lys, His, Thr, Val,
Asn, Ile, Leu or Tyr;

10 Xaa at position 102 is Gly, Glu, Lys, or Ser;
Xaa at position 104 is Trp, Val, Tyr, Met, or Leu;
Xaa at position 105 is Asn, Pro, Ala, Phe, Ser, Trp, Gln, Tyr,
Leu, Lys, Ile, Asp, or His;
Xaa at position 106 is Glu, Ser, Ala, or Gly;

15 Xaa at position 108 is Arg, Ala, Gln, Ser or Lys;
Xaa at position 109 is Arg, Thr, Glu, Leu, Ser, or Gly;
Xaa at position 112 is Thr, Val, Gln, Glu, His, or Ser;
Xaa at position 114 is Tyr or Trp;
Xaa at position 115 is Leu or Ala;

20 Xaa at position 116 is Lys, Thr, Met, Val, Trp, Ser, Leu, Ala, Asn,
Gln, His, Met, Phe, Tyr or Ile;
Xaa at position 117 is Thr, Ser, or Asn;
Xaa at position 119 is Glu, Ser, Pro, Leu, Thr, or Tyr;
Xaa at position 120 is Asn, Pro, Leu, His, Val, or Gln;

25 Xaa at position 121 is Ala, Ser, Ile, Asn, Pro, Lys, Asp, or
Gly;
Xaa at position 122 is Gln, Ser, Met, Trp, Arg, Phe, Pro, His,
Ile, Tyr, or Cys;
Xaa at position 123 is Ala, Met, Glu, His, Ser, Pro, Tyr, or Leu;

30 and which can additionally have Met- preceding the amino acid in
position 1; and wherein from 1 to 14 amino acids can be deleted
from the N-terminus and/or from 1 to 15 amino acids can be deleted
from the C-terminus; and wherein from one to three of the amino
35 acids designated by Xaa are different from the corresponding amino
acids of native (1-133) human interleukin-3 with the proviso that
when Xaa at position 34 is Gly or Xaa or position 46 is Lys or Ala
or/and Xaa at position 59 is Arg and/or Xaa at position 63 is Lys

251

and/or Xaa at position 75 is Gly and/or Xaa at position 98 is Arg then there must be at least one additional substitution besides the ones indicated.

5 3. A human interleukin-3 mutant polypeptide according to
claim 2 of the Formula III:

	Ala Pro Met Thr Gln Thr Thr Ser Leu Lys Thr Ser Trp Val Asn		
1	5	10	15
10	Cys Xaa Xaa Xaa Ile Xaa Glu Xaa Xaa Xaa Xaa Leu Lys Xaa Xaa		
	20	25	30
15	Xaa Xaa Xaa Xaa Xaa Asp Xaa Xaa Asn Leu Asn Xaa Glu Xaa Xaa		
	35	40	45
	Xaa Ile Leu Met Xaa Xaa Asn Leu Xaa Xaa Xaa Asn Leu Glu Xaa		
	50	55	60

	110	115	120
	Xaa Xaa Xaa Gln Gln Thr Thr Leu Ser Leu Ala Ile Phe [SEQ ID NO:17]		
	125	130	

35 wherein

Xaa at position 17 is Ser, Gly, Asp, Met, or Gln;
Xaa at position 18 is Asn, His, or Ile;
Xaa at position 19 is Met or Ile;

Xaa at position 21 is Asp or Glu;
Xaa at position 23 is Ile, Ala, Leu, or Gly;
Xaa at position 24 is Ile, Val, or Leu;
Xaa at position 25 is Thr, His, Gln, or Ala;
5 Xaa at position 26 is His or Ala;
Xaa at position 29 is Gln, Asn, or Val;
Xaa at position 30 is Pro, Gly, or Gln;
Xaa at position 31 is Pro, Asp, Gly, or Gln;
Xaa at position 32 is Leu, Arg, Gln, Asn, Gly, Ala, or Glu;
10 Xaa at position 33 is Pro or Glu;
Xaa at position 34 is Leu, Val, Gly, Ser, Lys, Ala, Arg, Gln,
Glu, Ile, Phe, Thr or Met;
Xaa at position 35 is Leu, Ala, Asn, Pro, Gln, or Val;
Xaa at position 37 is Phe, Ser, Pro, or Trp;
15 Xaa at position 38 is Asn or Ala;
Xaa at position 42 is Gly, Asp, Ser, Cys, Ala, Asn, Ile, Leu,
Met, Tyr or Arg;
Xaa at position 44 is Asp or Glu;
Xaa at position 45 is Gln, Val, Met, Leu, Thr, Ala, Asn, Glu,
20 Ser or Lys;
Xaa at position 46 is Asp, Phe, Ser, Thr, Ala, Asn Gln, Glu, His,
Ile, Lys, Tyr, Val or Cys;
Xaa at position 50 is Glu, Ala, Asn, Ser or Asp;
Xaa at position 51 is Asn, Arg, Met, Pro, Ser, Thr, or His;
25 Xaa at position 54 is Arg or Ala;
Xaa at position 54 is Arg or Ala;
Xaa at position 55 is Arg, Thr, Val, Leu, or Gly;
Xaa at position 56 is Pro, Gly, Ser, Gln, Ala, Arg, Asn, Glu,
Leu, Thr, Val or Lys;
30 Xaa at position 60 is Ala or Ser;
Xaa at position 62 is Asn, Pro, Thr, or Ile;
Xaa at position 63 is Arg or Lys;
Xaa at position 64 is Ala or Asn;
Xaa at position 65 is Val or Thr;
35 Xaa at position 66 is Lys or Arg;
Xaa at position 67 is Ser, Phe, or His;
Xaa at position 68 is Leu, Ile, Phe, or His;
Xaa at position 69 is Gln, Ala, Pro, Thr, Glu, Arg, or Gly;

Xaa at position 71 is Ala, Pro, or Arg;
Xaa at position 72 is Ser, Glu, Arg, or Asp;
Xaa at position 73 is Ala or Leu;
Xaa at position 76 is Ser, Val, Ala, Asn, Glu, Pro, or Gly;
5 Xaa at position 77 is Ile or Leu;
Xaa at position 79 is Lys, Thr, Gly, Asn, Met, Arg, Ile, Gly, or
Asp;
Xaa at position 80 is Asn, Gly, Glu, or Arg;
Xaa at position 82 is Leu, Gln, Trp, Arg, Asp, Ala, Asn, Glu, His,
10 Ile, Met, Phe, Ser, Thr, Tyr or Val;
Xaa at position 83 is Pro or Thr;
Xaa at position 85 is Leu or Val;
Xaa at position 87 is Leu or Ser;
Xaa at position 88 is Ala or Trp;
15 Xaa at position 91 is Ala or Pro;
Xaa at position 93 is Thr, Asp, Ser, Pro, Ala, Leu, or Arg;
Xaa at position 95 is His, Pro, Arg, Val, Leu, Gly, Asn, Phe, Ser
or Thr;
Xaa at position 96 is Pro or Tyr;
20 Xaa at position 97 is Ile or Val;
Xaa at position 98 is His, Ile, Asn, Leu, Ala, Thr, Leu, Arg, Gln,
Leu, Lys, Met, Ser, Tyr, Val or Pro;
Xaa at position 99 is Ile, Leu, or Val;
Xaa at position 100 is Lys, Arg, Ile, Gln, Pro, or Ser;
25 Xaa at position 101 is Asp, Pro, Met, Lys, His, Thr, Pro, Asn,
Ile, Leu or Tyr;
Xaa at position 104 is Trp or Leu;
Xaa at position 105 is Asn, Pro, Ala, Ser, Trp, Gln, Tyr, Leu,
Lys, Ile, Asp, or His;
30 Xaa at position 106 is Glu or Gly;
Xaa at position 108 is Arg, Ala, or Ser;
Xaa at position 109 is Arg, Thr, Glu, Leu, or Ser;
Xaa at position 112 is Thr, Val, or Gln;
Xaa at position 114 is Tyr or Trp;
35 Xaa at position 115 is Leu or Ala;
Xaa at position 116 is Lys, Thr, Val, Trp, Ser, Ala, His, Met,
Phe, Tyr or Ile;
Xaa at position 117 is Thr or Ser;

254

Xaa at position 120 is Asn, Pro, Leu, His, Val, or Gln;
Xaa at position 121 is Ala, Ser, Ile, Asn, Pro, Asp, or Gly;
Xaa at position 122 is Gln, Ser, Met, Trp, Arg, Phe, Pro, His,
Ile, Tyr, or Cys;

5 Xaa at position 123 is Ala, Met, Glu, His, Ser, Pro, Tyr, or Leu;

and which can additionally have Met- preceding the amino acid in
position 1; and wherein from 1 to 14 amino acids can be deleted
from the N-terminus and/or from 1 to 15 amino acids can be deleted
10 from the C-terminus; and wherein from one to three of the amino
acids designated by Xaa are different from the corresponding amino
acids of native (1-133)human interleukin-3 with the proviso that
when Xaa at position 34 is Gly and/or Xaa at position 46 is Lys or
Ala, and/or Xaa at position 63 is Lys, and/or Xaa at position 98 is
15 Arg, then two or three of the amino acid designated by Xaa are
different from the corresponding amino acids of the native (1-133)
human interleukin-3.

4. A human interleukin-3 mutant polypeptide according to
20 Claim 3 of the Formula IV:

Ala Pro Met Thr Gln Thr Thr Ser Leu Lys Thr Ser Trp Val Asn
1 5 10 15

25 Cys Xaa Xaa Met Ile Asp Glu Xaa Ile Xaa Xaa Leu Lys Xaa Xaa

Xaa Xaa Xaa Gln Gln Thr Thr Leu Ser Leu Ala Ile Phe [SEQ ID NO:18]
125 130

10 wherein

Xaa at position 17 is Ser, Gly, Asp, or Gln;

Xaa at position 18 is Asn, His, or Ile;

Xaa at position 23 is Ile, Ala, Leu, or Gly;

Xaa at position 25 is Thr, His, or Gln;

15 Xaa at position 26 is His or Ala;

Xaa at position 29 is Gln or Asn;

Xaa at position 30 is Pro or Gly;

Xaa at position 32 is Leu, Arg, Asn, or Ala;

Xaa at position 34 is Leu, Val, Ser, Ala, Arg, Gln, Glu, Ile,

20 Phe, Thr, or Met;

Xaa at position 35 is Leu, Ala, Asn, or Pro;

Xaa at position 38 is Asn or Ala;

Xaa at position 42 is Gly, Asp, Ser, Ala, Asn, Ile, Leu, Met,
Tyr or Arg;

25 Xaa at position 45 is Gln, Val, Met, Leu, Ala, Asn, Glu, or Lys;

Xaa at position 46 is Asp, Phe, Ser, Gln, Glu, His, Val
or Thr;

Xaa at position 50 is Glu Asn, Ser or Asp;

Xaa at position 51 is Asn, Arg, Pro, Thr, or His;

30 Xaa at position 55 is Arg, Leu, or Gly;

Xaa at position 56 is Pro, Gly, Ser, Ala, Asn, Val, Leu or Gln;

Xaa at position 62 is Asn, Pro, or Thr;

Xaa at position 64 is Ala or Asn;

Xaa at position 65 is Val or Thr;

35 Xaa at position 67 is Ser or Phe;

Xaa at position 68 is Leu or Phe;

Xaa at position 69 is Gln, Ala, Glu, or Arg;

Xaa at position 76 is Ser, Val, Asn, Pro, or Gly;

- Xaa at position 77 is Ile or Leu;
Xaa at position 79 is Lys, Gly, Asn, Met, Arg, Ile, or Gly;
Xaa at position 80 is Asn, Gly, Glu, or Arg;
Xaa at position 82 is Leu, Gln, Trp, Arg, Asp, Asn, Glu, His, Met,
5 Phe, Ser, Thr, Tyr or Val;
Xaa at position 87 is Leu or Ser;
Xaa at position 88 is Ala or Trp;
Xaa at position 91 is Ala or Pro;
Xaa at position 93 is Thr, Asp, or Ala;
10 Xaa at position 95 is His, Pro, Arg, Val, Gly, Asn, Ser or Thr;
Xaa at position 98 is His, Ile, Asn, Ala, Thr, Gln, Glu,
Lys, Met, Ser, Tyr, Val or Leu;
Xaa at position 99 is Ile or Leu;
Xaa at position 100 is Lys or Arg;
15 Xaa at position 101 is Asp, Pro, Met, Lys, Thr, His, Pro, Asn, Ile,
Leu or Tyr;
Xaa at position 105 is Asn, Pro, Ser, Ile or Asp;
Xaa at position 108 is Arg, Ala, or Ser;
Xaa at position 109 is Arg, Thr, Glu, Leu, or Ser;
20 Xaa at position 112 is Thr or Gln;
Xaa at position 116 is Lys, Val, Trp, Ala, His, Phe, Tyr or Ile;
Xaa at position 117 is Thr or Ser;
Xaa at position 120 is Asn, Pro, Leu, His, Val, or Gln;
Xaa at position 121 is Ala, Ser, Ile, Pro, or Asp;
25 Xaa at position 122 is Gln, Met, Trp, Phe, Pro, His, Ile, or Tyr;
Xaa at position 123 is Ala, Met, Glu, Ser, or Leu;

and which can additionally have Met- preceding the amino acid in
position 1; and wherein from 1 to 14 amino acids can be deleted
30 from the N-terminus and/or from 1 to 15 amino acids can be deleted
from the C-terminus; and wherein from one to three of the amino
acids designated by Xaa are different from the corresponding amino
acids of native (1-133)human interleukin-3.

35 5. A human interleukin-3 mutant polypeptide according to
claim 4 wherein said polypeptide has Ala at position 64.

6. The human interleukin-3 mutant polypeptide according to

Claim 1 wherein:

Xaa at position 17 is Ser, Lys, Asp, Met, Gln, or Arg;
Xaa at position 18 is Asn, His, Leu, Ile, Phe, Arg, or Gln;

5 Xaa at position 19 is Met, Arg, Gly, Ala, or Cys;
Xaa at position 20 is Ile, Cys, Gln, Glu, Arg, Pro, or Ala;
Xaa at position 21 is Asp, Phe, Lys, Arg, Ala, Gly, Glu, Gln, Thr,
Cer or Val;

Xaa at position 22 is Glu, Trp, Pro, Ser, Ala, His, Asp, Asn,
10 Val or Gly;

Xaa at position 23 is Ile, Ala, Gly, Trp, Lys, Leu, Ser, or
Arg;

Xaa at position 24 is Ile, Gly, Arg, or Ser;

Xaa at position 25 is Thr, His, Gly, Gln, Arg, Pro, or Ala;

15 Xaa at position 26 is His, Thr, Phe, Gly, Ala, or Trp;
Xaa at position 27 is Leu, Gly, Arg, Thr, Ser, or Ala;
Xaa at position 28 is Lys, Leu, Gln, Gly, Pro, Val or Trp;

Xaa at position 29 is Gln, Asn, Loh, Pro, Arg, or Val;

Xaa at position 30 is Pro, His, Thr, Gly, Asp, Gln, Ser, Leu, or
20 Lys;

Xaa at position 31 is Pro, Asp, Gly, Arg, Leu, or Gln;

Xaa at position 32 is Leu, Arg, Gln, Asn, Gly, Ala, or Glu;

Xaa at position 33 is Pro, Leu, Gln, Thr, or Glu;

Xaa at position 34 is Leu, Ser, Gln, Thr, Arg, Ala, or Lys;

25 Xaa at position 35 is Leu, Ala, Gly, Asn, Pro, or Gln;

Xaa at position 36 is Asp, Leu, or Val;

Xaa at position 37 is Phe, Ser, or Pro;

Xaa at position 38 is Asn, or Ala;

Xaa at position 40 is Leu, Trp, or Arg;

30 Xaa at position 41 is Asn, Cys, Arg, Leu, His, Met or Pro;

Xaa at position 42 is Gly, Asp, Ser, Cys, Lys, Asn, Thr, Leu, Val,
Glu, Phe, Tyr, Ile, Met or Ala;

Xaa at position 43 is Glu, Asn, Tyr, Leu, Phe, Asp, Ala, Cys, Arg,
Thr, Gly or Ser;

35 Xaa at position 44 is Asp, Ser, Leu, Arg, Lys, Thr, Met, Trp, Glu,
Gln, or Pro;

Xaa at position 45 is Gln, Pro, Phe, Val, Met, Leu, Thr, Lys, Asn,
Asp, Arg, Ser, Ala, Ile or Trp;

Xaa at position 46 is Asp, Phe, Ser, Thr, Cys, Glu, Gln, His, Tyr,
Ile, Val or Gly;

Xaa at position 47 is Ile, Gly, Ser, Arg, Pro, or His;

Xaa at position 48 is Leu, Ser, Cys, Arg, His, Phe, Glu, Lys, Thr,

5 Ala, Val or Asn;

Xaa at position 49 is Met, Arg, Ala, Gly, Pro, Asn, His, or Asp;

Xaa at position 50 is Glu, Leu, Thr, Asp, Asn, Ser, Ala, Ile, Val,
His, Phe, Met or Tyr;

Xaa at position 51 is Asn, Arg, Met, Pro, Ser, Thr, or His;

10 Xaa at position 52 is Asn, His, Arg, Leu, Gly, Ser, or Thr;

Xaa at position 53 is Leu, Thr, Ala, Gly, Glu, Pro, Lys, Ser,
or;

Xaa at position 54 is Arg, Asp, Ile, Ser, Val, Thr, Gln, Asn, Ala
or Leu;

15 Xaa at position 55 is Arg, Thr, Val, Ser, Leu, or Gly;

Xaa at position 56 is Pro, Gly, Cys, Ser, Gln, Glu, Gln, Arg, His,
Thr, Tyr, Phe, Leu, Val or Lys;

Xaa at position 57 is Asn or Gly;

Xaa at position 58 is Leu, Ser, Asp, Arg, Gln, Val, or Cys;

20 Xaa at position 59 is Glu Tyr, His, Leu;

Xaa at position 60 is Ala, Ser, Tyr, Asn, or Thr;

Xaa at position 61 is Phe, Asn, Glu, Pro, Lys, Arg, or Ser;

Xaa at position 62 is Asn His, Val, Arg, Pro, Thr, or Ile;

Xaa at position 63 is Arg, Tyr, Trp, Ser, Pro, or Val;

25 Xaa at position 64 is Ala, Asn, Ser, or Lys;

Xaa at position 65 is Val, Thr, Pro, His, Leu, Phe, or Ser;

Xaa at position 66 is Lys, Ile, Val, Asn, Glu, or Ser;

Xaa at position 67 is Ser, Ala, Phe, Val, Gly, Asn, Ile, Pro, or
His;

30 Xaa at position 68 is Leu, Val, Trp, Ser, Thr, or His;

Xaa at position 69 is Gln, Ala, Pro, Thr, Arg, Trp, Gly, or
Leu;

Xaa at position 70 is Asn, Leu, Val, Trp, Pro, or Ala;

Xaa at position 71 is Ala, Met, Leu, Arg, Glu, Thr, Gln,

35 Trp, or Asn;

Xaa at position 72 is Ser, Glu, Met, Ala, His, Asn, Arg, or Asp;

Xaa at position 73 is Ala, Glu, Asp, Leu, Ser, Gly, Thr, or Arg;

Xaa at position 74 is Ile, Thr, Pro, Arg, Gly, Ala;

- Xaa at position 75 is Glu, Lys, Asp, Pro, Trp, Ser,
or Leu;
- Xaa at position 76 is Ser, Val, Ala, Asn, Trp, Glu, Pro, Gly, or
Asp;
- 5 Xaa at position 77 is Ile, Ser, Arg, or Thr;
Xaa at position 78 is Leu, Ala, Ser, Glu, Gly, or Arg;
Xaa at position 79 is Lys, Thr, Gly, Asn, Met, Ile, or
Asp;
- Xaa at position 80 is Asn, Trp, Val, Gly, Thr, Leu, or Arg;
- 10 Xaa at position 81 is Leu, Gln, Gly, Ala, Trp, Arg, or Lys;
Xaa at position 82 is Leu, Gln, Lys, Trp, Arg, Glu, Asn, His, Thr,
Ser, Ala or Asp;
- Xaa at position 83 is Pro, Thr, Trp, Arg, or Met;
- Xaa at position 84 is Cys, Glu, Gly, Arg, Met, or Val;
- 15 Xaa at position 85 is Leu, Asn, or Gln;
Xaa at position 86 is Pro, Cys, Arg, Ala, or Lys;
Xaa at position 87 is Leu, Ser, Trp, or Gly;
Xaa at position 88 is Ala, Lys, Arg, Val, or Trp;
- Xaa at position 89 is Thr, Asp, Cys, Leu, Val, Glu, His, or Asn;
- 20 Xaa at position 90 is Ala, Ser, Asp, Ile, or Met;
Xaa at position 91 is Ala, Ser, Thr, Phe, Leu, Asp, or His;
Xaa at position 92 is Pro, Phe, Arg, Ser, Lys, His, Gly, Ile,
or Leu;
- Xaa at position 93 is Thr, Asp, Ser, Asn, Pro, Ala, Leu, or Arg;
- 25 Xaa at position 94 is Arg, Ile, Ser, Glu, Leu, Val, Gln, or Ala;
Xaa at position 95 is His, Gln, Pro, Val, Leu, Thr or Asn, Lys,
Ser, Ala, Trp, Phe, Ile or Tyr;
- Xaa at position 96 is Pro, Lys, Tyr, Gly, Ile, or Thr;
- Xaa at position 97 is Ile, Lys, Ala, or Asn;
- 30 Xaa at position 98 is His, Ile, Asn, Leu, Asp, Ala, Thr, Glu,
Ser, Phe, Met, Val, Lys, Tyr or Pro;
- Xaa at position 99 is Ile, Arg, Asp, Pro, Gln, Gly, Phe, or His;
- Xaa at position 100 is Lys, Tyr, Leu, His, Ile, Ser, Gln, or
Pro;
- 35 Xaa at position 101 is Asp, Pro, Met, Lys, His, Thr, Val, Tyr,
Glu, Ser, Ala, Gly, Ile, Leu, or Gln;
- Xaa at position 102 is Gly, Leu, Glu, Lys, Ser, Tyr, or Pro;
- Xaa at position 103 is Asp, or Ser;

Xaa at position 104 is Trp, Val, Cys, Tyr, Thr, Met, Pro, Leu, Gln, Lys, Ala, Phe, or Gly;

Xaa at position 105 is Asn, Pro, Ala, Phe, Ser, Trp, Gln, Tyr, Leu, Lys, Ile, or His;

5 Xaa at position 106 is Glu, Ser, Ala, Thr, Ile, Gly, or Pro;

Xaa at position 108 is Arg, Asp, Leu, Thr, Ile, Gln, Ser, Ala or Pro;

Xaa at position 109 is Arg, Thr, Pro, Glu, Tyr, Leu, Ser, or Gly;

Xaa at position 110 is Lys, Asn, Thr, Leu, Gln, His, Ser, Ala or

10 Trp;

Xaa at position 111 is Leu, Arg, or Asp;

Xaa at position 112 is Thr, Val, Tyr, Glu, or Phe;

Xaa at position 113 is Phe, Ser, Cys, His, Gly, Asp, Lys, or Asn;

Xaa at position 114 is Tyr, Cys, His, Ser, Arg, or Leu;

15 Xaa at position 115 is Leu, Asn, Pro, Arg, Ala, His, Thr, or Trp,;

Xaa at position 116 is Lys, Leu, Pro, Thr, Met, Asp, Val, Trp, Ser, Asn, Arg, Ala, Tyr, Phe, Met or Ile;

Xaa at position 117 is Thr, Ser, Asn, Ile, Trp, Lys, or Pro;

Xaa at position 118 is Leu, Ser, Pro, Ala, Glu, Cys, Asp, or Tyr;

20 Xaa at position 119 is Glu, Ser, Lys, Pro, Leu, Thr, Tyr, or Arg;

Xaa at position 120 is Asn, Ala, Pro, Leu, His, Val, or Gln;

Xaa at position 121 is Ala, Ser, Ile, Asn, Lys, Asp, or

Gly;

Xaa at position 122 is Gln, Ser, Met, Trp, Arg, Phe, Pro, Ile, Tyr,

25 or Cys;

Xaa at position 123 is Ala, Met, Glu, His, Ser, Tyr, or Leu.

7. The human interleukin-3 mutant polypeptide of
claim 1 wherein 1-15 amino acids are deleted from the C-terminus or
30 1-14 amino acids are deleted from the N-terminus.

8. The human interleukin-3 mutant polypeptide of
claim 1 wherein;

35 Xaa at position 42 is Gly, Asp, Ser, Ile, Leu, Met, Tyr, or Ala;

Xaa at position 45 is Gln, Val, Met or Asn;

Xaa at position 46 is Asp, Ser, Gln, His or Val;

Xaa at position 50 is Glu or Asp;

261

Xaa at position 51 is Asn, Pro or Thr;
Xaa at position 62 is Asn or Pro;
Xaa at position 76 is Ser, or Pro;
Xaa at position 82 is Leu, Trp, Asp, Asn Glu, His, Phe, Ser or Tyr;
5 Xaa at position 95 is His, Arg, Thr, Asn or Ser;
Xaa at position 98 is His, Ile, Leu, Ala, Gln, Lys, Met, Ser,
Tyr or Val;
Xaa at position 100 is Lys or Arg;
Xaa at position 101 is Asp, Pro, His, Asn, Ile or Leu;
10 Xaa at position 105 is Asn, or Pro;
Xaa at position 108 is Arg, Ala, or Ser;
Xaa at position 116 is Lys, Val, Trp, Ala, His, Phe, or Tyr;
Xaa at position 121 is Ala, or Ile;
Xaa at position 122 is Gln, or Ile; and
15 Xaa at position 123 is Ala, Met or Glu.

9. A (15-125) human interleukin-3 mutant polypeptide of the

wherein

Xaa at position 3 is Ser, Lys, Gly, Asp, Met, Gln, or Arg;

Xaa at position 4 is Asn, His, Leu, Ile, Phe, Arg, or Gln;

Xaa at position 5 is Met, Phe, Ile, Arg, Gly, Ala, or Cys;

10 Xaa at position 6 is Ile, Cys, Gln, Glu, Arg, Pro, or Ala;

Xaa at position 7 is Asp, Phe, Lys, Arg, Ala, Gly, Glu, Gln, Asn,
Thr, Ser or Val;Xaa at position 8 is Glu, Trp, Pro, Ser, Ala, His, Asp, Asn, Gln,
Leu, Val, or Gly;15 Xaa at position 9 is Ile, Val, Ala, Leu, Gly, Trp, Lys, Phe,
Leu, Ser, or Arg;

Xaa at position 10 is Ile, Gly, Val, Arg, Ser, Phe, or Leu;

Xaa at position 11 is Thr, His, Gly, Gln, Arg, Pro, or Ala;

Xaa at position 12 is His, Thr, Phe, Gly, Arg, Ala, or Trp;

20 Xaa at position 13 is Leu, Gly, Arg, Thr, Ser, or Ala;

Xaa at position 14 is Lys, Arg, Leu, Gln, Gly, Pro, Val or Trp;

Xaa at position 15 is Gln, Asn, Leu, Pro, Arg, or Val;

Xaa at position 16 is Pro, His, Thr, Gly, Asp, Gln, Ser, Leu, or
Lys;

25 Xaa at position 17 is Pro, Asp, Gly, Ala, Arg, Leu, or Gln;

Xaa at position 18 is Leu, Val, Arg, Gln, Asn, Gly, Ala, or Glu;

Xaa at position 19 is Pro, Leu, Gln, Ala, Thr, or Glu;

Xaa at position 20 is Leu, Val, Gly, Ser, Lys, Glu, Gln, Thr,
Arg, Ala, Phe, Ile or Met;

30 Xaa at position 21 is Leu, Ala, Gly, Asn, Pro, Gln, or Val;

Xaa at position 22 is Asp, Leu, or Val;

Xaa at position 23 is Phe, Ser, Pro, Trp, or Ile;

Xaa at position 24 is Asn, or Ala;

Xaa at position 26 is Leu, Trp, or Arg;

35 Xaa at position 27 is Asn, Cys, Arg, Leu, His, Met, Pro;

Xaa at position 28 is Gly, Asp, Ser, Cys, Ala, Lys, Asn, Thr, Leu,
Val, Glu, Phe, Tyr, Ile or Met;

Xaa at position 29 is Glu, Asn, Tyr, Leu, Phe, Asp, Ala, Cys, Gln,

Arg, Thr, Gly or Ser;

Xaa at position 30 is Asp, Ser, Leu, Arg, Lys, Thr, Met, Trp, Glu,
Asn, Gln, Ala or Pro;

Xaa at position 31 is Gln, Pro, Phe, Val, Met, Leu, Thr, Lys, Asp,
5 Asn, Arg, Ser, Ala, Ile, Glu, His or Trp;

Xaa at position 32 is Asp, Phe, Ser, Thr, Cys, Glu, Asn, Gln,
Lys, His, Ala, Tyr, Ile, Val or Gly;

Xaa at position 33 is Ile, Gly, Val, Ser, Arg, Pro, or His;

Xaa at position 34 is Leu, Ser, Cys, Arg, Ile, His, Phe, Glu,
10 Lys, Thr, Ala, Met, Val or Asn;

Xaa at position 35 is Met, Arg, Ala, Gly, Pro, Asn, His, or Asp;

Xaa at position 36 is Glu, Leu, Thr, Asp, Tyr, Lys, Asn, Ser, Ala,
Ile, Val, His, Phe, Met or Gln;

Xaa at position 37 is Asn, Arg, Met, Pro, Ser, Thr, or His;

15 Xaa at position 38 is Asn, His, Arg, Leu, Gly, Ser, or Thr;

Xaa at position 39 is Leu, Thr, Ala, Gly, Glu, Pro, Lys, Ser,
Met, or;

Xaa at position 40 is Arg, Asp, Ile, Ser, Val, Thr, Gln, Asn,
Lys, His, Ala or Leu;

20 Xaa at position 41 is Arg, Thr, Val, Ser, Leu, or Gly;

Xaa at position 42 is Pro, Gly, Cys, Ser, Gln, Glu, Arg, His,
Thr, Ala, Tyr, Phe, Leu, Val or Lys;

Xaa at position 43 is Asn or Gly;

Xaa at position 44 is Leu, Ser, Asp, Arg, Gln, Val, or Cys;

25 Xaa at position 45 is Glu, Tyr, His, Leu, Pro, or Arg;

Xaa at position 46 is Ala, Ser, Pro, Tyr, Asn, or Thr;

Xaa at position 47 is Phe, Asn, Glu, Pro, Lys, Arg, or Ser;

Xaa at position 48 is Asn, His, Val, Arg, Pro, Thr, Asp, or Ile;

Xaa at position 49 is Arg, Tyr, Trp, Lys, Ser, His, Pro, or Val;

30 Xaa at position 50 is Ala, Asn, Pro, Ser, or Lys;

Xaa at position 51 is Val, Thr, Pro, His, Leu, Phe, or Ser;

Xaa at position 52 is Lys, Ile, Arg, Val, Asn, Glu, or Ser;

Xaa at position 53 is Ser, Ala, Phe, Val, Gly, Asn, Ile, Pro, or
His;

35 Xaa at position 54 is Leu, Val, Trp, Ser, Ile, Phe, Thr, or His;

Xaa at position 55 is Gln, Ala, Pro, Thr, Glu, Arg, Trp, Gly, or
Leu;

Xaa at position 56 is Asn, Leu, Val, Trp, Pro, or Ala;

- Xaa at position 57 is Ala, Met, Leu, Pro, Arg, Glu, Thr, Gln, Trp, or Asn;
- Xaa at position 58 is Ser, Glu, Met, Ala, His, Asn, Arg, or Asp;
- Xaa at position 59 is Ala, Glu, Asp, Leu, Ser, Gly, Thr, or Arg;
- 5 Xaa at position 60 is Ile, Met, Thr, Pro, Arg, Gly, Ala;
- Xaa at position 61 is Glu, Lys, Gly, Asp, Pro, Trp, Arg, Ser, Gln, or Leu;
- Xaa at position 62 is Ser, Val, Ala, Asn, Trp, Glu, Pro, Gly, or Asp;
- 10 Xaa at position 63 is Ile, Ser, Arg, Thr, or Leu;
- Xaa at position 64 is Leu, Ala, Ser, Glu, Phe, Gly, or Arg;
- Xaa at position 65 is Lys, Thr, Gly, Asn, Met, Arg, Ile, or Asp;
- Xaa at position 66 is Asn, Trp, Val, Gly, Thr, Leu, Glu, or Arg;
- 15 Xaa at position 67 is Leu, Gln, Gly, Ala, Trp, Arg, Val, or Lys;
- Xaa at position 68 is Leu, Gln, Lys, Trp, Arg, Asp, Glu, Asn, His, Thr, Ser, Ala, Tyr, Phe, Ile, Met or Val;
- Xaa at position 69 is Pro, Ala, Thr, Trp, Arg, or Met;
- Xaa at position 70 is Cys, Glu, Gly, Arg, Met, or Val;
- 20 Xaa at position 71 is Leu, Asn, Val, or Gln;
- Xaa at position 72 is Pro, Cys, Arg, Ala, or Lys;
- Xaa at position 73 is Leu, Ser, Trp, or Gly;
- Xaa at position 74 is Ala, Lys, Arg, Val, or Trp;
- Xaa at position 75 is Thr, Asp, Cys, Leu, Val, Glu, His, Asn, or
- 25 Ser;
- Xaa at position 76 is Ala, Pro, Ser, Thr, Gly, Asp, Ile, or Met;
- Xaa at position 77 is Ala, Pro, Ser, Thr, Phe, Leu, Asp, or His;
- Xaa at position 78 is Pro, Phe, Arg, Ser, Lys, His, Ala, Gly, Ile or Leu;
- 30 Xaa at position 79 is Thr, Asp, Ser, Asn, Pro, Ala, Leu, or Arg;
- Xaa at position 80 is Arg, Ile, Ser, Glu, Leu, Val, Gln, Lys, His, Ala or Pro;
- Xaa at position 81 is His, Gln, Pro, Arg, Val, Leu, Gly, Thr, Asn, Lys, Ser, Ala, Trp, Phe, Ile or Tyr;
- 35 Xaa at position 82 is Pro, Lys, Tyr, Gly, Ile, or Thr;
- Xaa at position 83 is Ile, Val, Lys, Ala, or Asn;
- Xaa at position 84 is His, Ile, Asn, Leu, Asp, Ala, Thr, Glu, Gln, Ser, Phe, Met, Val, Lys, Arg, Tyr or Pro;

Xaa at position 85 is Ile, Leu, Arg, Asp, Val, Pro, Gln,
Gly, Ser, Phe, or His;

Xaa at position 86 is Lys, Tyr, Leu, His, Arg, Ile, Ser, Gln,
Pro;

5 Xaa at position 87 is Asp, Pro, Met, Lys, His, Thr, Val,
Tyr, Glu, Asn, Ser, Ala, Gly, Ile, Leu or Gln;

Xaa at position 88 is Gly, Leu, Glu, Lys, Ser, Tyr, or Pro;

Xaa at position 89 is Asp, or Ser;

Xaa at position 90 is Trp, Val, Cys, Tyr, Thr, Met, Pro, Leu,
10 Gln, Lys, Ala, Phe, or Gly;

Xaa at position 91 is Asn, Pro, Ala, Phe, Ser, Trp, Gln, Tyr,
Leu, Lys, Ile, Asp, or His;

Xaa at position 92 is Glu, Ser, Ala, Lys, Thr, Ile, Gly, or Pro;

Xaa at position 94 is Arg, Lys, Asp, Leu, Thr, Ile, Gln,
15 His, Ser, Ala, or Pro;

Xaa at position 95 is Arg, Thr, Pro, Glu, Tyr, Leu, Ser, or Gly;

Xaa at position 96 is Lys, Asn, Thr, Leu, Gln, Arg,
His, Glu, Ser, Ala or Trp;

Xaa at position 97 is Leu, Ile, Arg, Asp, or Met;

20 Xaa at position 98 is Thr, Val, Gln, Tyr, Glu, His, Ser, or Phe;

Xaa at position 99 is Phe, Ser, Cys, His, Gly, Trp, Tyr, Asp,
Lys, Leu, Ile, Val or Asn;

Xaa at position 100 is Tyr, Cys, His, Ser, Trp, Arg, or Leu;

Xaa at position 101 is Leu, Asn, Val, Pro, Arg, Ala, His, Thr,
25 Trp, or Met;

Xaa at position 102 is Lys, Leu, Pro, Thr, Met, Asp, Val, Glu, Arg,
Trp, Ser, Asn, His, Ala, Tyr, Phe, Gln, or Ile;

Xaa at position 103 is Thr, Ser, Asn, Ile, Trp, Lys, or Pro;

Xaa at position 104 is Leu, Ser, Pro, Ala, Glu, Cys, Asp, or Tyr;

30 Xaa at position 105 is Glu, Ser, Lys, Pro, Leu, Thr, Tyr, or Arg;

Xaa at position 106 is Asn, Ala, Pro, Leu, His, Val, or Gln;

Xaa at position 107 is Ala, Ser, Ile, Asn, Pro, Lys, Asp, or
Gly;

Xaa at position 108 is Gln, Ser, Met, Trp, Arg, Phe, Pro, His,
35 Ile, Tyr, or Cys;

Xaa at position 109 is Ala, Met, Glu, His, Ser, Pro, Tyr, or Leu;

and which can additionally have Met- or Met-Ala- preceding the

amino acid in position 1; and wherein from one to three of the amino acids designated by Xaa are different from the corresponding native amino acids of (1-133) human interleukin-3; or a polypeptide having substantially the same structure and substantially the same 5 biological activity.

10. A (15-125)human interleukin-3 mutant polypeptide of the Formula VI:

Xaa at position 65 is Lys, Thr, Gly, Asn, Met, Arg, Ile, Gly, or
Asp;
Xaa at position 66 is Asn, Gly, Glu, or Arg;
- 35 Xaa at position 68 is Leu, Gln, Trp, Arg, Asp, Ala, Asn, Glu,
His, Ile, Met, Phe, Ser, Thr, Tyr or Val;
Xaa at position 69 is Pro or Thr;
Xaa at position 71 is Leu or Val;

Xaa at position 73 is Leu or Ser;
Xaa at position 74 is Ala or Trp;
Xaa at position 77 is Ala or Pro;
Xaa at position 79 is Thr, Asp, Ser, Pro, Ala, Leu, or Arg;
5 Xaa at position 81 is His, Pro, Arg, Val, Leu, Gly, Asn, Phe,
 Ser or Thr;
Xaa at position 82 is Pro or Tyr;
Xaa at position 83 is Ile or Val;
Xaa at position 84 is His, Ile, Asn, Leu, Ala, Thr, Leu, Arg,
10 Gln, Leu, Lys, Met, Ser, Tyr, Val or Pro;
Xaa at position 85 is Ile, Leu, or Val;
Xaa at position 86 is Lys, Arg, Ile, Gln, Pro, or Ser;
Xaa at position 87 is Asp, Pro, Met, Lys, His, Thr, Asn, Ile,
 Leu or Tyr;
15 Xaa at position 90 is Trp or Leu;
Xaa at position 91 is Asn, Pro, Ala, Ser, Trp, Gln, Tyr, Leu,
 Lys, Ile, Asp, or His;
Xaa at position 92 is Glu, or Gly;
Xaa at position 94 is Arg, Ala, or Ser;
20 Xaa at position 95 is Arg, Thr, Glu, Leu, or Ser;
Xaa at position 98 is Thr, Val, or Gln;
Xaa at position 100 is Tyr or Trp;
Xaa at position 101 is Leu or Ala;
Xaa at position 102 is Lys, Thr, Val, Trp, Ser, Ala, His,
25 Met, Phe, Tyr or Ile;
Xaa at position 103 is Thr or Ser;
Xaa at position 106 is Asn, Pro, Leu, His, Val, or Gln;
Xaa at position 107 is Ala, Ser, Ile, Asn, Pro, Asp, or Gly;
Xaa at position 108 is Gln, Ser, Met, Trp, Arg, Phe, Pro, His,
30 Ile, Tyr, or Cys;
Xaa at position 109 is Ala, Met, Glu, His, Ser, Pro, Tyr, or Leu;

which can additionally have Met- or Met-Ala- preceding the amino acid in position 1; and wherein from one to three of the amino acids designated by Xaa are different from the corresponding amino acids of native (15-125)human interleukin-3; or a polypeptide having substantially the same structure and substantially the same biological activity.

12. A (15-125)human interleukin-3 mutant polypeptide according to Claim 7 of the Formula VIII:

5

Asn Cys Xaa Xaa Met Ile Asp Glu Xaa Ile Xaa Xaa Leu Lys Xaa
1 5 10 15

Xaa Pro Xaa Pro Xaa Xaa Asp Phe Xaa Asn Leu Asn Xaa Glu Asp
10 20 25 30

Xaa Xaa Ile Leu Met Xaa Xaa Asn Leu Arg Xaa Xaa Asn Leu Glu

Xaa Xaa Xaa Xaa Gln Gln [SEQ ID NO:22]

110

wherein

30 Xaa at position 3 is Ser, Gly, Asp, or Gln;
Xaa at position 4 is Asn, His, or Ile;
Xaa at position 9 is Ile, Ala, Leu, or Gly;
Xaa at position 11 is Thr, His, or Gln;
Xaa at position 12 is His or Ala;
35 Xaa at position 15 is Gln or Asn;
Xaa at position 16 is Pro or Gly;
Xaa at position 18 is Leu, Arg, Asn, or Ala;
Xaa at position 20 is Leu, Val, Ser, Ala, Arg, Gln, Glu, Ile,

Phe, Thr or Met;

Xaa at position 21 is Leu, Ala, Asn, or Pro;

Xaa at position 24 is Asn or Ala;

Xaa at position 28 is Gly, Asp, Ser, Ala, Asn, Ile, Leu, Met,

5 Tyr or Arg;

Xaa at position 31 is Gln, Val, Met, Leu, Ala, Asn, Glu or Lys;

Xaa at position 32 is Asp, Phe, Ser, Ala, Gln, Glu, His, Val
or Thr;

Xaa at position 36 is Glu, Asn, Ser or Asp;

10 Xaa at position 37 is Asn, Arg, Pro, Thr, or His;

Xaa at position 41 is Arg, Leu, or Gly;

Xaa at position 42 is Pro, Gly, Ser, Ala, Asn, Val, Leu or Gln;

Xaa at position 48 is Asn, Pro, or Thr;

Xaa at position 50 is Ala or Asn;

15 Xaa at position 51 is Val or Thr;

Xaa at position 53 is Ser or Phe;

Xaa at position 54 is Leu or Phe;

Xaa at position 55 is Gln, Ala, Glu, or Arg;

Xaa at position 62 is Ser, Val, Asn, Pro, or Gly;

20 Xaa at position 63 is Ile or Leu;

Xaa at position 65 is Lys, Asn, Met, Arg, Ile, or Gly;

Xaa at position 66 is Asn, Gly, Glu, or Arg;

Xaa at position 68 is Leu, Gln, Trp, Arg, Asp, Asn, Glu, His,
Met, Phe, Ser, Thr, Tyr or Val;

25 Xaa at position 73 is Leu or Ser;

Xaa at position 74 is Ala or Trp;

Xaa at position 77 is Ala or Pro;

Xaa at position 79 is Thr, Asp, or Ala;

Xaa at position 81 is His, Pro, Arg, Val, Gly, Asn, Ser or Thr;

30 Xaa at position 84 is His, Ile, Asn, Ala, Thr, Arg, Gln, Glu,
Lys, Met, Ser, Tyr, Val or Leu;

Xaa at position 85 is Ile or Leu;

Xaa at position 86 is Lys or Arg;

Xaa at position 87 is Asp, Pro, Met, Lys, His, Pro, Asn, Ile, Leu
35 or Tyr;

Xaa at position 91 is Asn, Pro, Ser, Ile or Asp;

Xaa at position 94 is Arg, Ala, or Ser;

Xaa at position 95 is Arg, Thr, Glu, Leu, or Ser;

Xaa at position 98 is Thr or Gln;
Xaa at position 102 is Lys, Val, Trp, or Ile;
Xaa at position 103 is Thr, Ala, His, Phe, Tyr or Ser;
Xaa at position 106 is Asn, Pro, Leu, His, Val, or Gln;
5 Xaa at position 107 is Ala, Ser, Ile, Pro, or Asp;
Xaa at position 108 is Gln, Met, Trp, Phe, Pro, His, Ile, or Tyr;
Xaa at position 109 is Ala, Met, Glu, Ser, or Leu;

and which can additionally have Met- or Met-Ala- preceding the
10 amino acid in position 1; and wherein from one to three of the
amino acids designated by Xaa are different from the corresponding
amino acids of native (1-133)human interleukin-3; or a polypeptide
having substantially the same structure and substantially the same
biological activity.

15

13. A (15-125) human interleukin-3 mutant polypeptide
according to claim 12 wherein said polypeptide has Ala at position
50.

20

14. A (15-125) human interleukin-3 mutant polypeptide
according to claim 9 with the proviso that when Xaa at position 22
is Leu, and/or Xaa at position 34 is Gly or Glu, and/or Xaa at
position 44 is Ala, and/or Xaa at position 46 is Lys or Ala, and/or
Xaa at position 50 is Lys, and/or Xaa at position 59 is Pro or Arg,
25 and/or Xaa at position 63 is Lys, and/or Xaa at position 75 is Gly
or Arg, and/or Xaa at position 94 is Pro, and/or Xaa at position 98
is Arg, and/or Xaa at position 106 is Lys, and/or Xaa at position
110 is Ala or Glu, and/or Xaa at position 111 is Met, then there
must be at least one additional substitution besides the ones
30 indicated.

15. A (15-125) human interleukin-3 mutant polypeptide
of claim 9 wherein:

Xaa at position 17 is Ser, Lys, Asp, Met, Gln, or Arg;
35 Xaa at position 18 is Asn, His, Leu, Ile, Phe, Arg, or Gln;
Xaa at position 19 is Met, Arg, Gly, Ala, or Cys;
Xaa at position 20 is Ile, Cys, Gln, Glu, Arg, Pro, or Ala;
Xaa at position 21 is Asp, Phe, Lys, Arg, Ala, Gly, or Val;

- Xaa at position 22 is Glu, Trp, Pro, Ser, Ala, His, or Gly;
Xaa at position 23 is Ile, Ala, Gly, Trp, Lys, Leu, Ser, or
Arg;
Xaa at position 24 is Ile, Gly, Arg, or Ser;
5 Xaa at position 25 is Thr, His, Gly, Gln, Arg, Pro, or Ala;
Xaa at position 26 is His, Thr, Phe, Gly, Ala, or Trp;
Xaa at position 27 is Leu, Gly, Arg, Thr, Ser, or Ala;
Xaa at position 28 is Lys, Leu, Gln, Gly, Pro, Val or Trp;
Xaa at position 29 is Gln, Asn, Loh, Pro, Arg, or Val;
10 Xaa at position 30 is Pro, His, Thr, Gly, Asp, Gln, Ser, Leu, or
Lys;
Xaa at position 31 is Pro, Asp, Gly, Arg, Leu, or Gln;
Xaa at position 32 is Leu, Arg, Gln, Asn, Gly, Ala, or Glu;
Xaa at position 33 is Pro, Leu, Gln, Thr, or Glu;
15 Xaa at position 34 is Leu, Gly, Ser, or Lys;
Xaa at position 35 is Leu, Ala, Gly, Asn, Pro, or Gln;
Xaa at position 36 is Asp, Leu, or Val;
Xaa at position 37 is Phe, Ser, or Pro;
Xaa at position 38 is Asn, or Ala;
20 Xaa at position 40 is Leu, Trp, or Arg;
Xaa at position 41 is Asn, Cys, Arg, Leu, His, Met, Pro;
Xaa at position 42 is Gly, Asp, Ser, Cys, or Ala;
Xaa at position 42 is Glu, Asn, Tyr, Leu, Phe, Asp, Ala, Cys, or
Ser;
25 Xaa at position 44 is Asp, Ser, Leu, Arg, Lys, Thr, Met, Trp, or
Pro;
Xaa at position 45 is Gln, Pro, Phe, Val, Met, Leu, Thr, Lys, or
Trp;
Xaa at position 46 is Asp, Phe, Ser, Thr, Cys, or Gly;
30 Xaa at position 47 is Ile, Gly, Ser, Arg, Pro, or His;
Xaa at position 48 is Leu, Ser, Cys, Arg, His, Phe, or Asn;
Xaa at position 49 is Met, Arg, Ala, Gly, Pro, Asn, His, or Asp;
Xaa at position 50 is Glu, Leu, Thr, Asp, or Tyr;
Xaa at position 51 is Asn, Arg, Met, Pro, Ser, Thr, or His;
35 Xaa at position 52 is Asn, His, Arg, Leu, Gly, Ser, or Thr;
Xaa at position 53 is Leu, Thr, Ala, Gly, Glu, Pro, Lys, Ser,
or;
Xaa at position 54 is Arg, Asp, Ile, Ser, Val, Thr, Gln, or Leu;

Xaa at position 55 is Arg, Thr, Val, Ser, Leu, or Gly;
Xaa at position 56 is Pro, Gly, Cys, Ser, Gln, or Lys;
Xaa at position 57 is Asn or Gly;
Xaa at position 58 is Leu, Ser, Asp, Arg, Gln, Val, or Cys;
5 Xaa at position 59 is Glu Tyr, His, Leu, Pro, or Arg;
Xaa at position 60 is Ala, Ser, Tyr, Asn, or Thr;
Xaa at position 61 is Phe, Asn, Glu, Pro, Lys, Arg, or Ser;
Xaa at position 62 is Asn His, Val, Arg, Pro, Thr, or Ile;
Xaa at position 63 is Arg, Tyr, Trp, Ser, Pro, or Val;
10 Xaa at position 64 is Ala, Asn, Ser, or Lys;
Xaa at position 65 is Val, Thr, Pro, His, Leu, Phe, or Ser;
Xaa at position 66 is Lys, Ile, Val, Asn, Glu, or Ser;
Xaa at position 67 is Ser, Ala, Phe, Val, Gly, Asn, Ile, Pro, or
His;
15 Xaa at position 68 is Leu, Val, Trp, Ser, Thr, or His;
Xaa at position 69 is Gln, Ala, Pro, Thr, Arg, Trp, Gly, or
Leu;
Xaa at position 70 is Asn, Leu, Val, Trp, Pro, or Ala;
Xaa at position 71 is Ala, Met, Leu, Arg, Glu, Thr, Gln,
20 Trp, or Asn;
Xaa at position 72 is Ser, Glu, Met, Ala, His, Asn, Arg, or Asp;
Xaa at position 73 is Ala, Glu, Asp, Leu, Ser, Gly, Thr, or Arg;
Xaa at position 74 is Ile, Thr, Pro, Arg, Gly, Ala;
Xaa at position 75 is Glu, Lys, Gly, Asp, Pro, Trp, Arg, Ser,
25 or Leu;
Xaa at position 76 is Ser, Val, Ala, Asn, Trp, Glu, Pro, Gly, or
Asp;
Xaa at position 77 is Ile, Ser, Arg, or Thr;
Xaa at position 78 is Leu, Ala, Ser, Glu, Gly, or Arg;
30 Xaa at position 79 is Lys, Thr, Gly, Asn, Met, Ile, or
Asp;
Xaa at position 80 is Asn, Trp, Val, Gly, Thr, Leu, or Arg;
Xaa at position 81 is Leu, Gln, Gly, Ala, Trp, Arg, or Lys;
Xaa at position 82 is Leu, Gln, Lys, Trp, Arg, or Asp;
35 Xaa at position 83 is Pro, Thr, Trp, Arg, or Met;
Xaa at position 84 is Cys, Glu, Gly, Arg, Met, or Val;
Xaa at position 85 is Leu, Asn, or Gln;
Xaa at position 86 is Pro, Cys, Arg, Ala, or Lys;

- Xaa at position 87 is Leu, Ser, Trp, or Gly;
Xaa at position 88 is Ala, Lys, Arg, Val, or Trp;
Xaa at position 89 is Thr, Asp, Cys, Leu, Val, Glu, His, or Asn;
Xaa at position 90 is Ala, Ser, Asp, Ile, or Met;
- 5 Xaa at position 91 is Ala, Ser, Thr, Phe, Leu, Asp, or His;
Xaa at position 92 is Pro, Phe, Arg, Ser, Lys, His, or Leu;
Xaa at position 93 is Thr, Asp, Ser, Asn, Pro, Ala, Leu, or Arg;
Xaa at position 94 is Arg, Ile, Ser, Glu, Leu, Val, or Pro;
Xaa at position 95 is His, Gln, Pro, Val, Leu, Thr or
- 10 Tyr;
Xaa at position 96 is Pro, Lys, Tyr, Gly, Ile, or Thr;
Xaa at position 97 is Ile, Lys, Ala, or Asn;
Xaa at position 98 is His, Ile, Asn, Leu, Asp, Ala, Thr, or
Pro;
- 15 Xaa at position 99 is Ile, Arg, Asp, Pro, Gln, Gly, Phe, or His;
Xaa at position 100 is Lys, Tyr, Leu, His, Ile, Ser, Gln, or
Pro;
Xaa at position 101 is Asp, Pro, Met, Lys, His, Thr, Val,
Tyr, or Gln;
- 20 Xaa at position 102 is Gly, Leu, Glu, Lys, Ser, Tyr, or Pro;
Xaa at position 103 is Asp, or Ser;
Xaa at position 104 is Trp, Val, Cys, Tyr, Thr, Met, Pro, Leu,
Gln, Lys, Ala, Phe, or Gly;
Xaa at position 105 is Asn, Pro, Ala, Phe, Ser, Trp, Gln, Tyr, Leu,
- 25 Lys, Ile, or His;
Xaa at position 106 is Glu, Ser, Ala, Lys, Thr, Ile, Gly, or Pro;
Xaa at position 108 is Arg, Asp, Leu, Thr, Ile, or Pro;
Xaa at position 109 is Arg, Thr, Pro, Glu, Tyr, Leu, Ser, or Gly.
- 30 16. The human interleukin-3 mutant polypeptide of claim 9:
wherein;
- Xaa at position 28 is Gly, Asp, Ser, Ile, Leu, Met, Tyr, or Ala;
Xaa at position 31 is Gln, Val, Met or Asn;
- 35 Xaa at position 32 is Asp, Ser, Ala, Gln, His or Val;
Xaa at position 36 is Glu or Asp;
Xaa at position 37 is Asn, Pro or Thr;
Xaa at position 48 is Asn or Pro;

Xaa at position 62 is Ser, or Pro;
Xaa at position 68 is Leu, Trp, Asp, Asn Glu, His, Phe, Ser or Tyr;
Xaa at position 81 is His, Arg, Thr, Asn or Ser;
Xaa at position 84 is His, Ile, Leu, Ala, Arg, Gln, Lys, Met, Ser,
5 Tyr or Val;
Xaa at position 86 is Lys or Arg;
Xaa at position 87 is Asp, Pro, His, Asn, Ile or Leu;
Xaa at position 91 is Asn, or Pro;
Xaa at position 94 is Arg, Ala, or Ser;
10 Xaa at position 102 is Lys, Val, Trp, Ala, His, Phe, or Tyr;
Xaa at position 107 is Ala, or Ile;
Xaa at position 108 is Gln, or Ile; and
Xaa at position 109 is Ala, Met or Glu.

17. A (15-125) human interleukin-3 mutant polypeptide
15 according to claim 15 with the proviso that when Xaa at position 34
is Gly, and/or Xaa at position 59 is Pro or Arg and/or Xaa at
position 75 is Gly or Arg, and/or Xaa at position 94 is Pro, and/or
Xaa at position 106 is Lys and/or Xaa at position 110 in Ala, then
there must be at least one additional substitution besides the ones
20 indicated.

18. A mutant human interleukin-3 polypeptide according
to claim 5 which is selected from the group consisting of
a polypeptide having an amino acid sequence corresponding to
25 SEQ ID NO:66;
a polypeptide having an amino acid sequence corresponding to
SEQ ID NO:67; and
a polypeptide having an amino acid sequence corresponding to
SEQ ID NO:69.

30 19. A pharmaceutical composition for the treatment of
hematopoietic cell deficiencies comprising a therapeutically
effective amount of a mutant human interleukin-3 polypeptide
selected from the group consisting of a polypeptide of claim 1, a
35 polypeptide of claim 2, a polypeptide of claim 3, a polypeptide of
claim 4, a polypeptide of claim 5, a polypeptide of claim 6, a
polypeptide of claim 7, a polypeptide of claim 8, a polypeptide of
claim 9, a polypeptide of claim 10, a polypeptide of claim 11, a

polypeptide of claim 12, a polypeptide of claim 13, a polypeptide of claim 14, a polypeptide of claim 15, a polypeptide of claim 16, a polypeptide of claim 17; a polypeptide of claim 18 and a pharmaceutically acceptable carrier.

5

20. A pharmaceutical composition according to Claim 18 for the treatment of hematopoietic cell deficiencies comprising a therapeutically effective amount of a mutant human interleukin-3 polypeptide selected from the group consisting of

- 10 a polypeptide having an amino acid sequence corresponding to SEQ ID NO:66;
 a polypeptide having an amino acid sequence corresponding to SEQ ID NO:67; and
 a polypeptide having an amino acid sequence corresponding to
15 SEQ ID NO:69.

21. A method of stimulating the production of hematopoietic cells which comprises administering a therapeutically effective amount of a mutant human interleukin-3 polypeptide
20 selected from the group consisting of a polypeptide of claim 1, a polypeptide of claim 2, a polypeptide of claim 3, a polypeptide of claim 4, a polypeptide of claim 5, a polypeptide of claim 6, a polypeptide of claim 7, a polypeptide of claim 8, a polypeptide of claim 9, a polypeptide of claim 10, a polypeptide of claim 11, a
25 polypeptide of claim 12, a polypeptide of claim 13, a polypeptide of claim 14, a polypeptide of claim 14, a polypeptide of claim 15, a polypeptide of claim 16, a polypeptide of claim 17, and a polypeptide of claim 18 to a patient in need of such treatment.

30 22. A method according to claim 21 of stimulating the production of hematopoietic cells which comprises administering a therapeutically effective amount of a mutant human interleukin-3 polypeptide selected from the group consisting of
 a polypeptide having an amino acid sequence corresponding to
35 SEQ ID NO:66; and
 a polypeptide having an amino acid sequence corresponding to SEQ ID NO:67.

23. A recombinant DNA sequence comprising vector DNA and a DNA that encodes a mutant human interleukin-3 polypeptide having the amino acid sequence of a polypeptide selected from the group consisting of a polypeptide of claim 1, a polypeptide of 5 claim 2, a polypeptide of claim 3, a polypeptide of claim 4, a polypeptide of claim 5, a polypeptide of claim 6, a polypeptide of claim 7, a polypeptide of claim 8, a polypeptide of claim 9, a polypeptide of claim 10, a polypeptide of claim 11, a polypeptide of claim 12, a polypeptide of claim 13, a polypeptide of claim 14, 10 a polypeptide of claim 15, a polypeptide of claim 16, a polypeptide of claim 17 and a polypeptide of claim 18.

24. A recombinant DNA sequence according to Claim 23 that encodes a mutant human interleukin-3 polypeptide selected from 15 the group consisting of
a polypeptide having an amino acid sequence corresponding to SEQ ID NO:66; and
a polypeptide having an amino acid sequence corresponding to SEQ ID NO:67.

20
25. A host cell containing a recombinant DNA sequence comprising vector DNA and a DNA that encodes a mutant human interleukin-3 polypeptide having the amino acid sequence of a polypeptide selected from the group consisting of a polypeptide of 25 claim 1, a polypeptide of claim 2, a polypeptide of claim 3, a polypeptide of claim 4, a polypeptide of claim 5, a polypeptide of claim 6, a polypeptide of claim 7, a polypeptide of claim 8, a polypeptide of claim 9, and a polypeptide of claim 10, a polypeptide of claim 11, a polypeptide of claim 12, a polypeptide of 30 claim 13, a polypeptide of claim 14, a polypeptide of claim 15, a polypeptide of claim 16, and a polypeptide of claim 17, a polypeptide of claim 18, and capable of expressing the encoded polypeptide.

35
26. A host cell according to claim 25 containing a recombinant DNA sequence that encodes a mutant human interleukin-3 polypeptide selected from the group consisting of
a polypeptide having an amino acid sequence corresponding to

SEQ ID NO:66;

a polypeptide having an amino acid sequence corresponding to
SEQ ID NO:67; and

a polypeptide having an amino acid sequence corresponding to
5 SEQ ID NO:69.

27. A method of producing a mutant human interleukin-3 polypeptide comprising the steps of:

10 (a) culturing a host cell containing a recombinant DNA sequence comprising vector DNA and a DNA sequence that encodes a mutant human interleukin-3 polypeptide having the amino acid sequence of a polypeptide selected from the group consisting of a polypeptide of claim 1, a polypeptide of claim 2, a polypeptide of
15 claim 3, a polypeptide of claim 4, a polypeptide of claim 5, a polypeptide of claim 6, a polypeptide of claim 7, a polypeptide of claim 8, a polypeptide of claim 9, a polypeptide of claim 10, a polypeptide of claim 11, a polypeptide of claim 12, a polypeptide of claim 13, a polypeptide of claim 14, a polypeptide of claim 14,
20 a polypeptide of claim 15, a polypeptide of claim 16, and a polypeptide of claim 17, a polypeptide of claim 18 and capable of expressing the encoded polypeptide under conditions permitting expression of the recombinant DNA; and

25 (b) harvesting the polypeptide from the culture.

28. A method of producing a mutant human interleukin-3 polypeptide comprising the steps of:

30 (a) culturing a host cell containing a recombinant DNA sequence comprising vector DNA and a DNA sequence that encodes a mutant human interleukin-3 polypeptide selected from the group consisting of
a polypeptide having an amino acid sequence corresponding to
35 SEQ ID NO:66; and
a polypeptide having an amino acid sequence corresponding to SEQ ID NO:67; and capable of expressing the encoded polypeptide under conditions permitting expression of the

recombinant DNA; and

(b) harvesting the polypeptide from the culture.

5 29. A vector containing a gene having a DNA sequence
that encodes a mutant human interleukin-3 polypeptide having the
amino acid sequence of a polypeptide selected from the group
consisting of a polypeptide of claim 1, a polypeptide of claim 2, a
polypeptide of claim 3, a polypeptide of claim 4, a polypeptide of
10 claim 5, a polypeptide of claim 6, a polypeptide of claim 7, a
polypeptide of claim 8, a polypeptide of claim 9, a polypeptide of
claim 10, a polypeptide of claim 11, a polypeptide of claim 12, a
polypeptide of claim 13, a polypeptide of claim 14, a polypeptide
of claim 14, a polypeptide of claim 15, a polypeptide of claim 16,
15 a polypeptide of claim 17 and a polypeptide of claim 18.

30. A recombinant DNA vector comprising a promoter, a
ribosome binding site, and a signal peptide directly linked to a
DNA sequence encoding a mutant human interleukin-3 polypeptide
20 selected from the group consisting of a polypeptide of claim 1, a
polypeptide of claim 2, a polypeptide of claim 3, a polypeptide of
claim 4, a polypeptide of claim 5, a polypeptide of claim 6, a
polypeptide of claim 7, a polypeptide of claim 8, a polypeptide of
claim 9, a polypeptide of claim 10, a polypeptide of claim 11, a
25 polypeptide of claim 12, a polypeptide of claim 13, a polypeptide
of claim 14, a polypeptide of claim 14, a polypeptide of claim 15,
a polypeptide of claim 16, a polypeptide of claim 17, and a
polypeptide of claim 18, said vector being capable of directing
expression of said mutant human interleukin-3 polypeptide.

30

31. A recombinant DNA vector comprising a promoter, a
ribosome binding site, and a signal peptide directly linked to a
DNA sequence encoding a mutant human interleukin-3 polypeptide
selected from the group consisting of
35 a polypeptide having an amino acid sequence corresponding to
SEQ ID NO:66;
a polypeptide having an amino acid sequence corresponding to
SEQ ID NO:67; and

a polypeptide having an amino acid sequence corresponding to SEQ ID NO:69; said vector being capable of directing expression of said mutant human interleukin-3 polypeptide.

5 32. A recombinant DNA vector according to Claim 30 wherein the promoter is AraBAD or recA.

33. A recombinant DNA vector according to Claim 30 wherein the ribosome binding site is g10-L.

10 34. A recombinant DNA vector according to Claim 30 wherein the signal peptide is a lamB signal peptide.

15 35. A recombinant DNA vector according to Claim 30 wherein the signal peptide is the lamB signal peptide depicted in Figure 8.

20 36. A recombinant DNA vector according to Claim 30 wherein the promoter is AraBAD or recA and the ribosome binding site is g10-L.

37. A recombinant DNA vector according to Claim 30 wherein the promoter is AraBAD, the ribosome binding site is g10-L, and the signal peptide is a lamB signal peptide.

25 38. A recombinant DNA vector according to Claim 30 wherein the promoter is AraBAD, the ribosome binding site is g10-L, and the signal peptide is the lamB signal peptide depicted in Figure 8.

30 39. A recombinant bacterial host which comprises the vector of Claim 30 wherein said host secretes a mutant human interleukin-3 polypeptide selected from the group consisting of a polypeptide having an amino acid sequence corresponding to SEQ ID NO:66; a polypeptide having an amino acid sequence corresponding to

285

SEQ ID NO:67; and

a polypeptide having an amino acid sequence corresponding to

SEQ ID NO:69
